Revision History

Revision	Date	Author	Description
1.0	May 18, 2021	AWA1896	Initial release version
1.1	August 30, 2021	AWA1896	Update the section 8; add the section 9.15
1.2	January 25, 2022	KPA0570	Remove the section 2.2.11.13 and 9.15; Update section 2.3
1.3	March 3, 2022	KPA0570	Add the section 2.2.11.13 and 9.15; update section 2.3
1.4	April 22, 2022	KPA0570	Update section 2.2.9.4, section 3.2.3.3, section 3.2.3.4, section 3.2.5, section 3.2.6, section 8.3, table 9-21, section 9.7.5, section 9.7.5.26, table 9-20, table 9-25
1.5	July 22, 2022	KPA0570	Update figure 2-2, figure 2-3, section 2.2.8.7, figure 3-4, figure 3-5, table 3-3

1 About This Document

1.1 Purpose and Scope

This document describes the features, logical structures, functions, operating modes, and related registers of each module about T113-S3. For details about the interface timings and related parameters, the pins, pin usages, performance parameters, and package dimension, please refer to the T113-S3 Datasheet.

1.2 Intended Audience

The document is intended for:

- Design and maintenance personnel for electronics
- Programmers in writing code or modifying the Allwinner provided code

1.3 Symbol Conventions

1.3.1 Symbol Conventions

The symbols that may be found in this document are defined as follows.

Symbol	Description
 WARNING	Indicates potential risk of injury or death exists if the instructions are not obeyed.
 CAUTION	Indicates potential risk of equipment damage, data loss, performance degradation, or unexpected results exists if the instructions are not obeyed.
 NOTE	Provides additional information to emphasize or supplement important points of the main text.

1.3.2 Table Content Conventions

The table content conventions that may be found in this document are defined as follows.

Symbol	Description
/	The cell is blank.

1.3.3 Reset Value Conventions

In the register definition tables:

If other column value in a bit or multiple bits row is “/”, that this bit or these multiple bits are unused.

If the default value of a bit or multiple bits is “UDF”, that the default value is undefined.

1.3.4 Register Attributes

The register attributes that may be found in this document are defined as follows.

Symbol	Description
R	Read Only
R/W	Read/Write
R/WAC	Read/Write-Automatic-Clear, clear the bit automatically when the operation of complete. Writing 0 has no effect
R/WC	Read/Write-Clear
R/W0C	Read/Write 0 to Clear. Writing 1 has no effect
R/W1C	Read/Write 1 to Clear. Writing 0 has no effect
R/W1S	Read/Write 1 to Set. Writing 0 has no effect
W	Write Only

1.3.5 Numerical System

The expressions of data capacity, frequency, and data rate are described as follows.

Type	Symbol	Value
Data capacity	1 K	1024
	1 M	1,048,576
	1 G	1,073,741,824
Frequency, data rate	1 k	1000
	1 M	1,000,000
	1 G	1,000,000,000

The expressions of addresses and data are described as follows.

Symbol	Example	Description
0x	0x0200, 0x79	Address or data in hexadecimal
0b	0b010, 0b00 000 111	Data or sequence in binary (register description is excluded.)
X	00X, XX1	In data expression, X indicates 0 or 1. For example, 00X indicates 000 or 001 and XX1 indicates 001, 011, 101 or 111.

2 Product Description

2.1 Overview

T113-S3 is an advanced application processor. It integrates dual-core Cortex™-A7 CPU and single-core HiFi4 DSP to provide the high efficient computing power. T113-S3 supports full format decoding such as H.265, H.264, MPEG-1/2/4, JPEG, VC1, and so on. The independent hardware encoder can encode in JPEG or MJPEG. Integrated multi ADCs/DACs and I2S/PCM/DMIC/OWA audio interfaces can provide the perfect voice interaction solution. T113-S3 comes with extensive connectivity to facilitate product expansion, such as USB, SDIO, EMAC, TWI, UART, SPI, PWM, GPADC, IR TX&RX, and so on.

2.2 Features

2.2.1 CPU Architecture

- Dual-core ARM Cortex™-A7
- 32 KB L1 I-cache + 32 KB L1 D-cache per core, and 256 KB L2 cache

2.2.2 DSP Architecture

- HiFi4
- 32 KB L1 I-cache and 32 KB L1 D-cache
- 64 KB I-ram and 64 KB D-ram

2.2.3 Memory SubSystem

2.2.3.1 Boot ROM (BROM)

- On-chip memory
- Supports system boot from the following devices:
 - SD card
 - eMMC
 - SPI NOR Flash
 - SPI NAND Flash

- Supports mandatory upgrade process through USB and SD card
- Supports GPIO pin and eFuse module to select the boot media type
- Supports normal booting and secure booting
- Secure BROM loads only certified firmware
- Secure BROM ensures that the Secure Boot is in a trusted environment

2.2.3.2 SDRAM

- Embedded with 128 MB DDR3
- Supports clock frequency up to 800 MHz

2.2.3.3 SMHC

- Three SD/MMC host controller (SMHC) interfaces
- The SMHC0 controls the devices that comply with the protocol Secure Digital Memory (SD mem-version 3.0)
- The SMHC1 controls the device that complies with the protocol Secure Digital I/O (SDIO-version 3.0)
- The SMHC2 controls the device that complies with the protocol Multimedia Card (eMMC-version 5.0)
- Maximum performance:
 - SDR mode 150 MHz@1.8 V IO pad
 - DDR mode 50 MHz@1.8 V IO pad
 - DDR mode 50 MHz@3.3 V IO pad
- Supports 1-bit or 4-bit data width
- Supports block size of 1 to 65535 bytes
- Internal 1024-Bytes RX FIFO and 1024-Bytes TX FIFO
- Supports card insertion and removal interrupt
- Supports hardware CRC generation and error detection
- Supports descriptor-based internal DMA controller

2.2.4 Video Engine

- Video decoding
 - H.265 MP@L4.1 up to 1080p@60fps
 - H.264 BP/MP/HP@L4.2 up to 1080p@60fps
 - H.263 BP up to 1080p@60fps
 - MPEG-4 SP/ASP L5.0 up to 1080p@60fps
 - MPEG-2 MP/HL up to 1080p@60fps
 - MPEG-1 MP/HL up to 1080p@60fps
 - JPEG/Xvid/Sorenson Spark up to 1080p@60fps
 - MJPEG up to 1080p@30fps
- Video encoding
 - JPEG/MJPEG up to 1080p@60fps
 - Supports input picture scaler up/down

2.2.5 Video and Graphics

2.2.5.1 Display Engine (DE)

- Output size up to 2048 x 2048
- Supports two alpha blending channels for main display and one channel for aux display
- Supports four overlay layers in each channel, and has an independent scaler
- Supports porter-duff compatible blending operation
- Supports LBC buffer decoder
- Supports dither output to TCON
- Supports input format Semi-planar YUV422/YUV420/YUV411 and Planar YUV422/YUV420/YUV411, ARGB8888/XRGB8888/RGB888/ARGB4444/ARGB1555/RGB565/palette
- Supports SmartColor2.0 for excellent display experience
 - Adaptive detail/edge enhancement
 - Adaptive color enhancement
 - Adaptive contrast enhancement and fresh tone rectify
- Supports write back for aux display

2.2.5.2 De-interlacer (DI)

- Supports YUV420 (Planar/NV12/NV21) and YUV422 (Planar/NV16/NV61) data format
- Supports video resolution from 32 x 32 to 2048 x 1280 pixel
- Supports Inter-field interpolation/motion adaptive de-interlace method
- Performance: module clock 600M for 1080p@60Hz YUV420

2.2.5.3 Graphic 2D (G2D)

- Supports layer size up to 2048 x 2048 pixels
- Supports pre-multiply alpha image data
- Supports color key
- Supports two pipes Porter-Duff alpha blending
- Supports multiple video formats 4:2:0, 4:2:2, 4:1:1 and multiple pixel formats (8/16/24/32 bits graphics layer)
- Supports memory scan order option
- Supports any format convert function
- Supports 1/16x to 32x resize ratio
- Supports 32-phase 8-tap horizontal anti-alias filter and 32-phase 4-tap vertical anti-alias filter
- Supports window clip
- Supports FillRectangle, BitBlit, StretchBlit and MaskBlit
- Supports horizontal and vertical flip, clockwise 0/90/180/270 degree rotate for normal buffer
- Supports horizontal flip, clockwise 0/90/270 degree rotate for LBC buffer

2.2.6 Video Output

2.2.6.1 RGB and LVDS LCD

- Supports RGB interface with DE/SYNC mode, up to 1920 x 1080@60fps
- Supports serial RGB/dummy RGB interface, up to 800 x 480@60fps
- Supports LVDS interface with dual link, up to 1920 x 1080@60fps
- Supports LVDS interface with single link, up to 1366 x 768@60fps

- Supports i8080 interface, up to 800 x 480@60fps
- Supports BT656 interface for NTSC and PAL
- RGB666 and RGB565 with dither function
- Gamma correction with R/G/B channel independence

2.2.6.2 MIPI DSI

- Compliance with MIPI DSI v1.01
- Supports 4-lane MIPI DSI, up to 1920 x 1200@60fps resolution
- Supports non-burst mode with sync pulse/sync event and burst mode
- Supports pixel format: RGB888, RGB666, RGB666 loosely packed and RGB565
- Supports continuous and non-continuous lane clock modes
- Supports bidirectional communication of all generic commands in LP through data lane 0
- Supports low power data transmission
- Supports ULPS and escape modes
- Hardware checksum capabilities

2.2.6.3 CVBS OUT

- 1-channel CVBS output
- Supports NTSC and PAL format
- Plug status auto detecting
- 10 bits DAC output

2.2.7 Video Input

2.2.7.1 Parallel CSI

- Supports 8-bit digital camera interface (RAW8/YUV422/YUV420)
- Supports BT656, BT601 interface (YUV422)
- Supports ITU-R BT.656 time-multiplexed format up to 2*1080p@30fps in DDR sample mode

- Maximum pixel clock of 148.5 MHz
- Supports de-interlacing for interlace video input
- Supports conversion from YUV422 to YUV420, YUV422 to YUV400, YUV420 to YUV400
- Supports horizontal and vertical flip

2.2.7.2 CVBS IN

- 2-channel CVBS input and 1-channel CVBS decoder
- Supports NTSC and PAL format
- Supports YUV422/YUV420 format
- With 1 channel 3D comb filter
- Detection for signal locked and 625 lines
- Programmable brightness, contrast, and saturation
- 10-bit video ADCs

2.2.8 System Peripherals

2.2.8.1 Timer

- The timer module implements the timing and counting functions, which includes timer0, timer1, watchdog, and audio video synchronization (AVS)
- The timer0/timer1 is a 32-bit down counter. The timer0 and timer1 are completely consistent
- The watchdog is used to transmit a reset signal to reset the entire system when an exception occurs in the system
- The AVS is used to synchronize the audio and video. The AVS sub-block includes AVS0 and AVS1, which are completely consistent

2.2.8.2 High Speed Timer (HSTimer)

- The HSTimer module consists of HSTimer0 and HSTimer1. HSTimer0 and HSTimer1 are down counters that implement timing and counting functions. They are completely consistent.
- Configurable 56-bit down timer

- Supports 5 prescale factors
- The clock source is synchronized with AHB0 clock, much more accurate than other timers
- Supports 2 working modes: periodic mode and single counting mode
- Generates an interrupt when the count is decreased to 0

2.2.8.3 GIC

- Supports 16 Software Generated Interrupts (SGIs), 16 Private Peripheral Interrupts (PPIs), and 192 Shared Peripheral Interrupts (SPIs)
- Software-configurable interrupts can be:
 - Enabled or disabled
 - Assigned to one of two groups: Group 0 or Group 1
 - Prioritized
 - Signaled to different processors in multiprocessor implementations
 - Either level-sensitive or edge-triggered
- GIC security extensions
 - Uses Group 0 interrupts as Secure interrupts, and Group 1 interrupts as Non-secure interrupts
 - Uses the FIQ interrupt request to signal Secure interrupts to a connected processor. The GIC-400 always signals Group 1 interrupts using the IRQ interrupt request

2.2.8.4 DMAC

- Up to 16-ch DMA
- Provides 32 peripheral DMA requests for data reading and 32 peripheral DMA requests for data writing
- Flexible data width of 8/16/32/64-bit
- Programmable DMA burst length
- Supports linear and IO address modes
- Supports data transfer types with memory-to-memory, memory-to-peripheral, peripheral-to-memory, peripheral-to-peripheral
- Supports transfer with linked list
- DRQ response includes waiting mode and handshake mode

- DMA channel supports pause function
- Memory devices support non-aligned transform

2.2.8.5 Clock Controller Unit (CCU)

- 8 PLLs
- One on-chip RC oscillator
- Supports one external 24 MHz DCXO and one external 32.768 kHz oscillator
- Supports clock configuration and clock generation for corresponding modules
- Supports software-controlled clock gating and software-controlled reset for corresponding modules

2.2.8.6 Thermal Sensor Controller (THS)

- One thermal sensor located in CPU
- Temperature accuracy: $\pm 3^{\circ}\text{C}$ from 0°C to $+100^{\circ}\text{C}$, $\pm 5^{\circ}\text{C}$ from -25°C to $+125^{\circ}\text{C}$
- Averaging filter for thermal sensor reading
- Supports over-temperature protection interrupt and over-temperature alarm interrupt

2.2.8.7 LDO Power

- Integrated 2 LDOs (LDOA, LDOB)
- LDOA: 1.8 V power output, LDOB: 1.35 V/1.5 V/1.8 V power output
- LDOA for IO and analog module
- Input voltage is 2.4 V to 3.6 V

2.2.8.8 RTC

- Implements time counter and timing wakeup
- Provides a 16-bit counter for counting day, 5-bit counter for counting hour, 6-bit counter for counting minute, 6-bit counter for counting second
- External connect a 32.768 kHz low-frequency oscillator for count clock

- Timer frequency is 1 kHz
- Configurable initial value by software anytime
- Supports timing alarm, and generates interrupt and wakeup the external devices
- 8 general purpose registers for storing power-off information

2.2.8.9 I/O Memory Management Unit (IOMMU)

- Supports virtual address to physical address mapping by hardware implementation
- Supports VE, CSI, DE, G2D, DI parallel address mapping
- Supports VE, CSI, DE, G2D, DI bypass function independently
- Supports VE, CSI, DE, G2D, DI pre-fetch independently
- Supports VE, CSI, DE, G2D, DI interrupt handing mechanism independently
- Supports 2 levels TLB (level1 TLB for special using, and level2 TLB for sharing)
- Supports TLB Fully cleared and Partially disabled
- Supports trigger PTW behavior when TLB miss
- Supports checking the permission

2.2.8.10 Message Box (MSGBOX)

- Supports two CPU to transmit information through channels. Each CPU has a MSGBOX
 - CPU 0: ARM CPUX
 - CPU 1: DSP
- The channel between two CPU has 4 channels, and the FIFO depth of a channel is 8 x 32 bits

2.2.8.11 Spinlock

- Provides hardware synchronization mechanism in multi-core systems
- Supports 32 lock units
- Two kinds of lock status: locked and unlocked
- Lock time of the processor is predictable (less than 200 cycles)

2.2.9 Audio Interfaces

2.2.9.1 Audio Codec

- Two audio digital-to-analog converter (DAC) channels
 - Supports 16-bit and 20-bit sample resolution
 - 8 kHz to 192 kHz DAC sample rate
 - 100 ± 2 dB SNR@A-weight, -85 ± 3 dB THD+N
- One audio output:
 - One stereo headphone output: HPOUTL/R
- Three audio analog-to-digital converter (ADC) channels
 - Supports 16-bit and 20-bit sample resolution
 - 8 kHz to 48 kHz ADC sample rate
 - 95 ± 3 dB SNR@A-weight, -80 ± 3 dB THD+N
- Three audio inputs:
 - One differential microphone input: MICIN3P/3N, or one single-end microphone input: MICIN3P
 - One stereo LINEIN input: LINEINL/R
 - One stereo FMIN input: FMINL/R
- Stereo headphone driver
 - 95 ± 3 dB SNR@A-weight
 - Output Level 0.55 Vrms@ $10\text{ k}\Omega$ /THD+N - 77 ± 3 dB, 0.37 Vrms@ $16\text{ }\Omega$ /THD+N -40 dB
- Supports Dynamic Range Controller adjusting the DAC playback and ADC recording
- One 128x20-bits FIFO for DAC data transmit, one 128x20-bits FIFO for ADC data receive
- Programmable FIFO thresholds
- Supports interrupts and DMA
- Internal HPLDO output for HPVCC
- Internal ALDO output for AVCC

2.2.9.2 I2S/PCM

- Two I2S/PCM external interfaces (I2S1, I2S2) for connecting external power amplifier and MIC ADC

- Compliant with standard Philips Inter-IC sound (I2S) bus specification
 - Left-justified, Right-justified, PCM mode, and Time Division Multiplexing (TDM) format
 - Programmable PCM frame width: 1 BCLK width (short frame) and 2 BCLKs width (long frame)
- Transmit and Receive data FIFOs
 - Programmable FIFO thresholds
 - 128 depth x 32-bit width TXFIFO and 64 depth x 32-bit width RXFIFO
- Supports multiple function clock
 - Clock up to 24.576 MHz Data Output of I2S/PCM in Master mode (Only if the IO PAD and Peripheral I2S/PCM satisfy Timing Parameters)
 - Clock up to 12.288 MHz Data Input of I2S/PCM in Master mode
- Supports TX/RX DMA slave interface
- Supports multiple application scenarios
 - Up to 16 channels ($f_s = 48$ kHz) which has adjustable width from 8-bit to 32-bit
 - Sample rate from 8 kHz to 384 kHz (CHAN = 2)
 - 8-bit u-law and 8-bit A-law companded sample
- Supports master/slave mode

2.2.9.3 DMIC

- Supports maximum 8 digital PDM microphones
- Supports sample rate from 8 kHz to 48 kHz

2.2.9.4 One Wire Audio (OWA)

- One OWA TX
- Compliance with S/PDIF interface
- IEC-60958 transmitter functionality
- Supports 16-bit, 20-bit, and 24-bit data formats
- One 128×24bits TXFIFO for audio data transfer
- Programmable FIFO thresholds

- Supports TX DMA slave interface
- Function clock includes 24.576 MHz and 22.579 MHz frequency
- Hardware parity generation on the transmitter
- Supports channel status insertion for the transmitter
- Supports interrupts and DMA

2.2.10 Security System

2.2.10.1 Crypto Engine (CE)

- Supports Symmetrical algorithm for encryption and decryption: AES, DES, TDES
 - Supports ECB, CBC, CTS, CTR, CFB, OFB mode for AES
 - Supports 128/192/256-bit key for AES
 - Supports ECB, CBC, CTR mode for DES/TDES
- Supports Hash algorithm for tamper proofing: MD5, SHA, HMAC
 - Supports SHA1, SHA224, SHA256, SHA384, SHA512 for SHA
 - Supports HMAC-SHA1, HMAC-SHA256 for HMAC
 - Supports multi-package mode for MD5/SHA1/SHA224/SHA256/SHA384/SHA512
- Supports Asymmetrical algorithm for signature verification: RSA
 - RSA supports 512/1024/2048-bit width
- Supports 160-bit hardware PRNG with 175-bit seed
- Supports 256-bit hardware TRNG
- Internal DMA controller for data transfer with memory

2.2.10.2 Security ID (SID)

- Supports 2 Kbits eFuse
- Backup eFuse information by using SID_SRAM
- Burning the key to the SID
- Reading the key use status in the SID
- Loading the key to the CE

2.2.10.3 Secure Memory Control (SMC)

- The SMC is always secure, only secure CPU can access the SMC
- Sets secure area of DRAM
- Sets secure property that Master accesses to DRAM

2.2.10.4 Secure Peripherals Control (SPC)

- The SPC is always secure, only secure CPU can access the SPC
- Sets secure property of peripherals

2.2.11 External Peripherals

2.2.11.1 USB DRD

- One USB 2.0 DRD (USB0), with integrated USB 2.0 analog PHY
- Complies with USB2.0 Specification
- Supports USB Host function
 - Compatible with Enhanced Host Controller Interface (EHCI) Specification, Version 1.0
 - Compatible with Open Host Controller Interface (OHCI) Specification, Version 1.0a
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s), and Low-Speed (LS, 1.5 Mbit/s)
 - Supports only 1 USB Root port shared between EHCI and OHCI
- Supports USB Device function
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s)
 - Supports bi-directional endpoint0 (EPO) for Control transfer
 - Up to 10 user-configurable endpoints (EP1+, EP1-, EP2+, EP2-, EP3+, EP3-, EP4+, EP4-, EP5+, EP5-) for Bulk transfer, Isochronous transfer and Interrupt transfer
 - Up to (8 KB + 64 Bytes) FIFO for all EPs (including EPO)
 - Supports interface to an external Normal DMA controller for every EP
- Supports an internal DMA controller for data transfer with memory

- Supports High-Bandwidth Isochronous & Interrupt transfers
- Automated splitting/combining of packets for Bulk transfers
- Supports point-to-point and point-to-multipoint transfer in both Host and Peripheral modes
- Includes automatic ping capabilities
- Soft connect/disconnect function
- Performs all transaction scheduling in hardware
- Power optimization and power management capabilities
- Device and host controller share a 8K SRAM and a physical PHY

2.2.11.2 USB HOST

- One USB 2.0 HOST (USB1), with integrated USB 2.0 analog PHY
- Complies with USB2.0 Specification
- Supports USB2.0 Host function
 - Compatible with Enhanced Host Controller Interface (EHCI) Specification, Version 1.0
 - Compatible with Open Host Controller Interface (OHCI) Specification, Version 1.0a
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s) and Low-Speed (LS, 1.5 Mbit/s) Device
 - Supports only 1 USB Root port shared between EHCI and OHCI
- An internal DMA Controller for data transfer with memory

2.2.11.3 EMAC

- One EMAC interface for connecting external Ethernet PHY
- 10/100/1000 Mbit/s Ethernet port with RGMII and RMII interfaces
- Compliant with IEEE 802.3-2002 standard
- Supports both full-duplex and half-duplex operation
- Provides the management data input/output (MDIO) interface for PHY device configuration and management with configurable clock frequencies
- Programmable frame length to support Standard or Jumbo Ethernet frames with sizes up to 16 KB

- Supports a variety of flexible address filtering modes
- Separate 32-bit status returned for transmission and reception packets
- Optimization for packet-oriented DMA transfers with frame delimiters
 - Supports linked-list descriptor list structure
 - Descriptor architecture, allowing large blocks of data transfer with minimum CPU intervention; each descriptor can transfer up to 4 KB of data
 - Comprehensive status reporting for normal operation and transfers with errors
- 4 KB TXFIFO for transmission packets and 16 KB RXFIFO for reception packets
- Programmable interrupt options for different operational conditions

2.2.11.4 UART

- Up to 6 UART controllers (UART0, UART1, UART2, UART3, UART4, UART5)
- UART0, UART4, UART5: 2-wire; UART1, UART2, UART3: 4-wire
- Compatible with industry-standard 16450/16550 UARts
- Supports IrDA-compatible slow infrared (SIR) format
- Two separate FIFOs: one is RX FIFO, and the other is TX FIFO
 - Each of them is 64 bytes (For UART0)
 - Each of them is 256 bytes (For UART1, UART2, UART3, UART4, and UART5)
- The working reference clock is from the APB bus clock
 - Speed up to 4 Mbit/s with 64 MHz APB clock
 - Speed up to 1.5 Mbit/s with 24 MHz APB clock
- 5 to 8 data bits for RS-232 characters, or 9 bits RS-485 format
- 1, 1.5 or 2 stop bits
- Programmable parity (even, odd, or no parity)
- Supports TX/RX DMA slave controller interface
- Supports software/hardware flow control
- Supports RX DMA Master interface (Only for UART1)
- Supports auto-flow by using CTS & RTS (Only for UART1/2/3)

2.2.11.5 Two Wire Interface (TWI)

- Up to 4 TWI controllers (TWI0, TWI1, TWI2, TWI3)
- Compliant with I2C bus standard
- Supports standard mode (up to 100 kbit/s) and fast mode (up to 400 kbit/s)
- Supports 7-bit and 10-bit device addressing modes
- Supports master mode or slave mode
- Master mode features:
 - Supports the bus arbitration in the case of multiple master devices
 - Supports clock synchronization and bit and byte waiting
 - Supports packet transmission and DMA
- Slave mode features:
 - Interrupt on address detection
- The TWI controller includes one TWI engine and one TWI driver. And the TWI driver supports packet transmission and DMA mode when TWI works in master mode

2.2.11.6 SPI and SPI_DBI

- Up to 2 SPI controllers (SPI0, SPI1)
- The SPI0 only supports SPI mode; The SPI1 supports SPI mode and display bus interface (DBI) mode
- SPI mode:
 - Full-duplex synchronous serial interface
 - Master/slave configurable
 - Mode0 to Mode3 are supported for both transmit and receive operations
 - 8-bit wide by 64-entry FIFO for both transmit and receive data
 - Polarity and phase of the Chip Select (SPI-CS) and SPI Clock (SPI-CLK) are configurable
 - Supports 3-wire/4-wire SPI
 - Supports programmable serial data frame length: 1-bit to 32-bit
 - Supports Standard SPI, Dual-Output/Dual-Input SPI, Dual IO SPI, Quad-Output/Quad-Input SPI
- DBI mode:
 - Supports DBI Type C 3 Line/4 Line Interface Mode

- Supports 2 Data Lane Interface Mode
- Supports RGB111/444/565/666/888 video format
- Maximum resolution of RGB666 240 x 320@30Hz with single data lane
- Maximum resolution of RGB888 240 x 320@60Hz or 320 x 480@30Hz with dual data lane
- Supports Tearing effect
- Supports software flexible control video frame rate

2.2.11.7 CIR Receiver (CIR_RX)

- One CIR_RX interface (IR-RX)
- Full physical layer implementation
- Supports NEC format infra data
- Supports CIR for remote control or wireless keyboard
- 64x8 bits FIFO for data buffer
- Sample clock up to 1 MHz

2.2.11.8 CIR Transmitter (CIR_TX)

- One CIR_TX interface (IR-TX)
- Supports arbitrary wave generator
- Configurable carrier frequency
- Supports handshake mode and waiting mode of DMA
- 128 bytes FIFO for data buffer

2.2.11.9 PWM

- Supports 8 independent PWM channels (PWM0 to PWM7)
 - Supports PWM continuous mode output
 - Supports PWM pulse mode output, and the pulse number is configurable
 - Output frequency range: 0 to 24 MHz or 100 MHz

- Various duty-cycle: 0% to 100%
- Minimum resolution: 1/65536
- Supports 4 complementary pairs output
 - PWM01 pair (PWM0 + PWM1), PWM23 pair (PWM2 + PWM3), PWM45 pair (PWM4 + PWM5), PWM67 pair (PWM6 + PWM7)
 - Supports dead-zone generator, and the dead-zone time is configurable
- Supports 4 group of PWM channel output for controlling stepping motors
 - Supports any plural channels to form a group, and output the same duty-cycle pulse
 - In group mode, the relative phase of the output waveform for each channel is configurable
- Supports 8 channels capture input
 - Supports rising edge detection and falling edge detection for input waveform pulse
 - Supports pulse-width measurement for input waveform pulse

2.2.11.10 General Purpose ADC (GPADC)

- 1-ch Successive approximation register (SAR) analog-to-digital converter (ADC)
- 12-bit sampling resolution and 8-bit precision
- 64 FIFO depth of data register
- Power reference voltage: AVCC, analog input voltage range: 0 to AVCC
- Maximum sampling frequency up to 1 MHz
- Supports three operation modes: single conversion mode, continuous conversion mode, burst conversion mode

2.2.11.11 Touch Panel ADC (TPADC)

- 12 bit SAR type A/D converter
- Configurable sample frequency up to 1 MHz
- One 32x12 FIFO for storing A/D conversion result
- Supports DMA slave interface
- Supports 4-wire resistive touch panel input detection

- Supports pen down detection with programmable sensitivity
- Supports single touch coordinate measurement
- Supports dual touch detection
- Supports touch pressure measurement with programmable threshold
- Supports median and averaging filter for noise reduction
- Supports X and Y coordinate exchange function
- Supports Aux ADC with up to 4 channels

2.2.11.12 LEDC

- LEDC is used to control the external intelligent control LED lamp
- Configurable LED output high/low level width
- Configurable LED reset time
- LEDC data supports DMA configuration mode and CPU configuration mode
- Maximum 1024 LEDs serial connect
- LED data transfer rate up to 800 kbit/s

2.2.11.13 CAN

- Supports industry-standard AMBA Peripheral Bus (APB) and it is fully compliant with the AMBA Specification, Revision 2.0
- Supports APB 32-bit bus width operation
- Supports the CAN 2.0A and 2.0B protocol specification
- Supports one-shot transmission option
- Supports two configurable filter modes
- Supports listen only mode
- Supports self-test mode

2.2.12 Package

- eLQFP128, 14 mm x 14 mm x 1.4 mm

3.2 CPUX Configuration

3.2.1 Overview

CPUX indicates the ARM CPU subsystem. You can configure the CPUX via the CO_CPUX_CFG and CPU_SUBSYS_CTRL modules.

The CO_CPUX_CFG module is used for configuring Cluster0. Cluster0 is the only cluster which consists of dual-core CortexTM-A7, 32 KB I-cache and 32 KB D-cache per core, and the shared 256 KB L2 cache. The CO_CPUX_CFG module includes the following features:

- CPU reset system: core reset, debug circuit reset, and other functional modules reset
- CPU related control: interface control, CP15 control, and power-on/off control
- CPU status check: idle status, SMP status, interrupt status, and so on
- CPU debug-related register for control and status

The CPU_SUBSYS_CTRL module is used for controlling CPU subsystem resources, such as GIC-400 and JTAG.

3.2.2 Functional Descriptions

3.2.2.1 Signal Description

For details of A7 CPUX signals, refer to the technical reference manual of [DDI0464F_cortex_A7_mpcore_r0p5_trm.pdf](#).

3.2.2.2 L2 Idle Mode

Enter the L2 idle mode by configuring the L2 cache of Cluster to enter the wait for interrupt (WFI) mode.

Follow the steps below:

1. Make sure CPU[1:0] of Cluster has entered the WFI mode. You can check it through bit[17:16] of [Cluster0 CPU Status Register](#).
2. Pull high the [ACINACTM](#) of Cluster by writing 1 to the bit0 of [Cluster 0 Control Register1](#).
3. Check whether L2 enters idle status by checking whether the [STANDBYWFL2](#) is high.

To exit the L2 idle mode, set the [ACINACTM](#) to low.

3.2.2.3 CPU Reset System

There are three levels of CPUX reset, with the scope size from small to large: core reset, power-on Reset, and H_Reset.

The following table describes all the reset signals in the CPUX reset system.

Table 3-1 Reset Signal Description

Reset Signal	Description
CORE_RST	This is the primary reset signal which resets the corresponding core logic, including NEON, VFP, Debug, ETM, breakpoint, and watchpoint logic. It maps to a warm reset that covers the reset of the processor logic.
PWRON_RST	This power-on reset signal resets all the processor logic, including the Debug, ETM trace unit, breakpoint, watchpoint logic, and performance monitors logic. It maps to a cold reset that covers the reset of the processor logic and the integrated debug functionality. It does not reset debug logic in the debug power domain. PWRON_RST includes CORE_RST, ETM_RST, and DBG_RST.
H_RST	H_RST includes PWRON_RST, L2_RST, MBIST_RST, SOC_DBG_RST, and CO_CPUX_CFG.
AXI2MBUS_RST	This reset signal resets the AXI2MBUS interface logic circuit.
L2_RST	This single, cluster-wide signal resets the L2 memory system and the logic in the SCU.
ETM_RST	This reset signal resets ETM debug logic circuit.
DBG_RST	In the processor power domain, this reset signal resets only the debug, breakpoint, and watchpoint logic. In the debug power domain, it resets the debug logic for each processor.
SOC_DBG_RST	This reset signal resets all the debug logic. It includes DBG_RST.
MBIST_RST	This reset signal resets all resettable registers in the cluster, for entry into and exit from MBIST mode.
CPU_SUBSYS_RST	CPU_SUBSYS_RST includes CO_H_RST, GIC-400, and CPU_SUBSYS_CTRL.

3.2.2.4 CPUX Power Block Diagram

The following table shows the power domain of the modules in the CPU subsystem.

Table 3-2 Power Domain of Modules in the CPU Subsystem

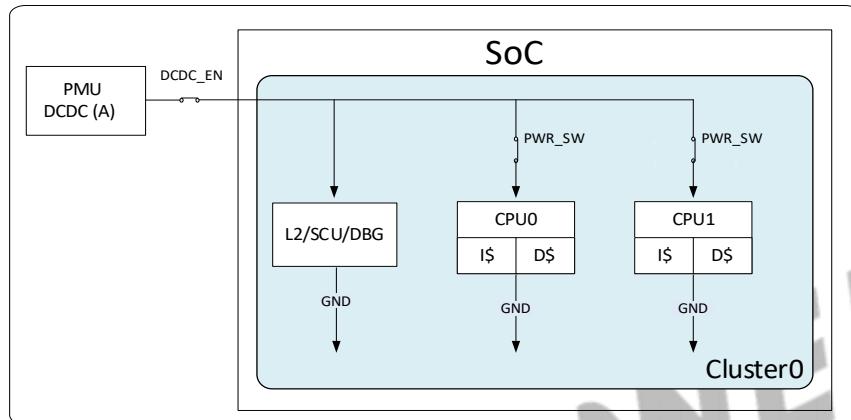

Power Domain	Modules	Description
Cluster0	Cluster0, CO_CPUX_CFG, and CO_MBIST	Cluster0 circuit, CO_CPUX_CFG module, and CPU reset/power/mbist
System	Timestamp, GIC, CPU_SUBSYS_CTRL, and Clock	Provides system source of CPU sub-system

As shown in the table, C0_CPUX_CFG belongs to Cluster0 power domain and CPU_SUBSYS_CTRL belongs to the system power domain.

Because C0_CPUX_CFG and Cluster0 belong to the same power domain, C0_CPUX_CFG holds in the default state when Cluster0 restarts. You need to initial C0_CPUX_CFG via software after C0_H_RST is de-asserted.

The following figure shows the default power domain of Cluster0.

Figure 3-1 Default Power Domain of Cluster0

For Cluster0, the power switch of all CPU cores are on, the PWRON_RST of all CPU cores are de-asserted, the CORE_RST of CPU0 is de-asserted, and the CORE_RST of CPU1 is asserted.

3.2.2.5 CPUX Power Block Diagram

The CPU-related operations, such as opening/closing cores, clustering switches, and querying status, require proper configurations of C0_CPUX_CFG module and the related system control resources like the bus and clock.

3.3 Clock Controller Unit (CCU)

3.3.1 Overview

The clock controller unit (CCU) controls the PLL configurations and most of the clock generation, division, distribution, synchronization, and gating. The input signals of the CCU include the external clock for the reference frequency (24 MHz). The outputs from the CCU are mostly clocks to other blocks in the system.

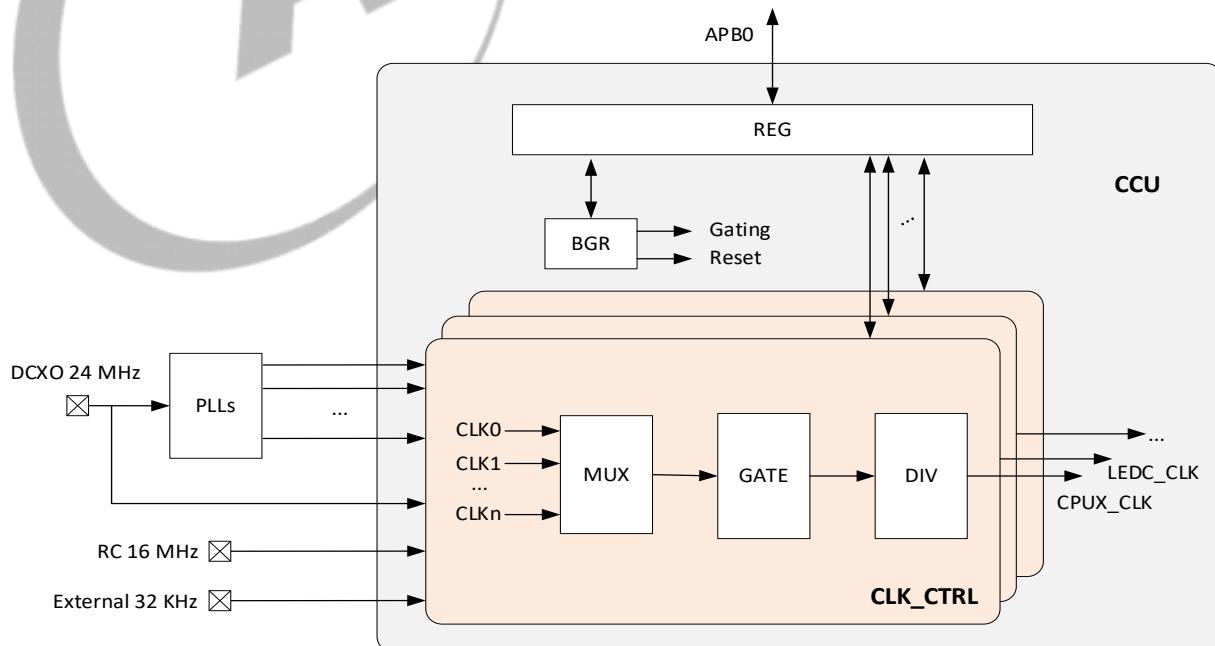

The CCU includes the following features:

- 8 PLLs
- Bus source and divisions
- Clock output control
- Configuring modules clock
- Bus clock gating
- Bus software reset

3.3.2 Block Diagram

The following figure shows the functional block diagram of the CCU.

3.3.3 Functional Description

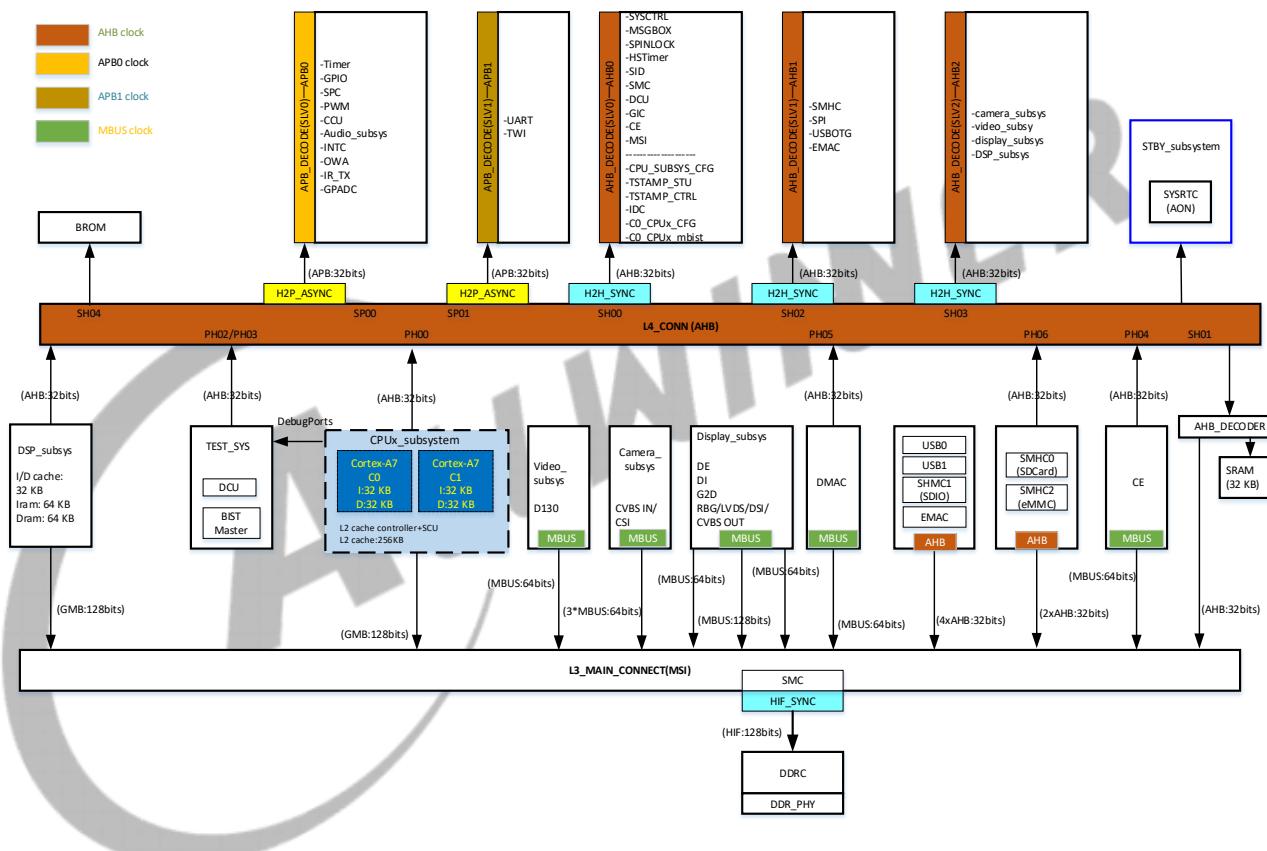

3.3.3.1 System Bus Tree

The system buses include advanced high-performance buses (AHBs), advanced peripheral buses (APBs), and MBUS.

All devices mounted at the bus should use the related bus clocks, and the gating signals for the bus are from the CCU module.

The following figure shows the diagram of the System Bus Tree.

3.3.4 Programming Guidelines

3.3.4.1 Configuring the Frequency of PLL_CPUX

The frequency configuration formula of PLL_CPUX:

$$\text{PLL_CPUX} = 24 \text{ MHz} * N/P$$

The parameter N is the frequency-doubling factor of PLL. The next parameter configuration can proceed after the PLL relock. The parameter P is a digital post-frequency-division factor, which can be dynamically switched in real-time, without affecting the normal work of PLL.

PLL_CPUX supports dynamic frequency adjustment (modifying the value of N). However, for the system stability, to configure the frequency of the PLL_CPUX from a higher value to a lower one, switch the clock source of the CPU to another clock whose frequency is not higher than the current one first, and configure PLL_CPUX to the target low frequency, and then switch the clock source of the CPU back to PLL_CPUX.

Follow the steps below to adjust the frequency of PLL_CPUX:

- Step 1** Before you configure PLL_CPUX, switch the clock source of CPU to PLL_PERI(1X).
- Step 2** Modify the parameters N and P of PLL_CPUX.
- Step 3** Write the PLL Lock Enable bit (bit[29]) of [PLL CPU CTRL REG](#) to 0 and then to 1.
- Step 4** Wait for the Lock bit (bit[28]) of [PLL CPU CTRL REG](#) to change to 1.
- Step 5** Switch the clock source of the CPU to PLL_CPUX.

3.3.4.2 Configuring the Frequency of PLL_AUDIO

PLL_AUDIO includes PLL_AUDIO0 and PLL_AUDIO1.

The frequency configuration formula of PLL_AUDIO:

$$\text{PLL_AUDIO0} = 24 \text{ MHz} * N/M0/M1/P/4$$

$$\text{PLL_AUDIO1} = 24 \text{ MHz} * N/M$$

PLL_AUDIO does not support dynamic adjustment because changing any parameter of N, M0, M1, and P will affect the normal work of PLL, and the PLL will need to be relocked.

Generally, PLL_AUDIO only needs two frequency points: 24.576*4 MHz or 22.5792*4 MHz. For these two frequencies, there are usually special recommended matching factors. To implement the desired frequency point of PLL_AUDIO, you need to use the decimal frequency-division function, so follow the steps below:

- Step 1** Configure the N, M0, M1 and P factors.
- Step 2** Configure [PLL_AUDIOx Control Register](#)[PLL_SDM_ENABLE] to 1.
- Step 3** Configure [PLL_AUDIOx Pattern0 Control Register](#) to enable the digital spread spectrum.
- Step 4** Write [PLL_AUDIOx Control Register](#)[Lock Enable] to 0 and then to 1.
- Step 5** Wait for [PLL_AUDIOx Control Register](#)[Lock] to 1.

When the P factor of PLL_AUDIO is an odd number, the clock output is an unequal-duty-cycle signal.

The recommended values for configuration factors of PLL_AUDIO1 are as follows.

Table 3-5 Recommended Values for Configuration Factors of PLL_AUDIO1

Mode	Clock Source (MHz)	Frequency-doubling N	VCO (MHz)	Post Frequency-Division	PLL Output (MHz)	Divisor	Actual Operating Frequency (MHz)	Description
Integer divider	24	128	3072	2	1536	4	384	Provide clock source for peripherals

Decimal divider	24	98.304	2359.296	2	1179.648	2	589.824	Provides clock source for peripheral devices
						3	393.216	
						6	196.608	
						12	98.304	

Mode	Clock Source (MHz)	Frequency-doubling N	VCO (MHz)	Post Frequency-Division	PLL Output (MHz)	Divisor	Actual Operating Frequency (MHz)	Description
						48	24.576	For audio-related modules
				5	471.8592			

3.3.4.3 Configuring the Frequency of General PLLs

- Step 1** Make sure the PLL is enabled. If not, refer to section 3.3.4.4 [Enabling the PLL](#) to enable the PLL.
- Step 2** Configure the PLL_OUTPUT_ENABLE bit (bit[27]) of the PLL control register as 0 to disable the output gate of the PLL because general PLLs are unavailable in the process of frequency modulation.
- Step 3** Configure the N and M factors. (It is not suggested to configure M1 factor).
- Step 4** Write the LOCK_ENABLE bit (bit[29]) of the PLL control register to 0 and then to 1.
- Step 5** Wait for the LOCK bit (bit[28]) of the PLL control register to 1.
- Step 6** Configure PLL_OUTPUT_ENABLE bit (bit[27]) of the PLL control register to 1.

3.3.4.4 Enabling the PLL

Follow the steps below to enable the PLL:

- Step 1** Configure the N, M, and P factors of the PLL control register.
- Step 2** Write the PLL_ENABLE bit and the LDO_EN bit of the PLL control register to 1, write the PLL_OUTPUT_GATE bit of the PLL control register to 0.
- Step 3** Write the LOCK_ENABLE bit of the PLL control register to 1.
- Step 4** Wait for the status of the Lock to change to 1.
- Step 5** Delay 20 us.
- Step 6** Write the PLL_OUTPUT_GATE bit of the PLL control register to 1 and then the PLL will be available.

3.3.4.5 Disabling the PLL

Follow the steps below to disable the PLL:

Step 1 Write the PLL_ENABLE bit (bit[31]) and the LDO_EN bit of the PLL control register to 0.

Step 2 Write the LOCK_ENABLE bit (bit[29]) of the PLL control register to 0.

CAUTION

In the normal use of PLLs, it is unsuggested to enable and disable the PLLs frequently. Turning on and off the PLLs will cause mutual interference between PLLs, which will affect the stability of the system. When the clock is unnecessary, you can write 0 to the PLL_OUTPUT_EN bit of the PLL control register to disable the output gate of the PLL, instead of writing 0 to the Enable bit to disable the PLL.

3.3.4.6 Configuring Bus Clock

The bus clock supports dynamic switching, but the process of switching needs to follow the following two rules.

- From a higher frequency to a lower frequency: switch the clock source first, and then set the frequency division factor;
- From a lower frequency to a higher frequency: configure the frequency division factor first, and then switch the clock source.

3.3.4.7 Configuring Module Clock

For the Bus Gating Reset register of a module, the reset bit is de-asserted first, and then the clock gating bit is enabled to avoid potential problems caused by the asynchronous release of the reset signal.

For all module clocks except the DDR clock, configure the clock source and frequency division factor first, and then release the clock gating (that is, set to 1). For the configuration order of the clock source and frequency division factor, follow the rules below:

- With the increasing of the clock source frequency, configure the frequency division factor before the clock source;
- With the decreasing of the clock source frequency, configure the clock source before the frequency division factor.

3.3.4.8 Implementing Spread Spectrum

The spread spectrum technology is to convert a narrowband signal into a wideband signal. It helps to reduce the effect of electromagnetic interference (EMI) associated with the fundamental frequency of the signal.

For the general PLL frequency, the calculation formula is as follows:

$$f = \frac{N+1+X}{P \cdot (M_0+1) \cdot (M_1+1)} \cdot 24\text{MHz}, 0 < X < 1$$

Where,

P is the frequency division factor of module or PLL;

M₀ is the post-frequency division factor of PLL;

M₁ is the pre-frequency division factor of PLL;

N is the frequency doubling factor of PLL;

X is the amplitude coefficient of the spread spectrum.

The parameters N, P, M₁, and M₀ are for the frequency division.

When M₁ = 0, M₀ = 0, and P = 1 (no frequency division), the calculation formula of PLL frequency can be simplified as follows:

$$f = (N+1+X) \cdot 24\text{MHz}, 0 < X < 1$$

$$[f_1, f_2] = (N+1+[X_1, X_2]) \cdot 24\text{MHz}$$

$$SDM_BOT = 2^{17} \cdot X_1$$

$$WAVE_STEP = 2^{17} \cdot (X_2 - X_1) / (24\text{MHz}/PREQ) \cdot 2$$

Where, SDM_BOT and WAVE_STEP are bits of the PLL pattern control register, and PREQ is the frequency of the spread spectrum.

Different PLLs have different calculate formulas, refer to the CTRL register of the corresponding PLL in section 3.3.6 [Register Description](#).

Configuration Procedure

Follow the steps below to implement the spread spectrum:

Step 1 Configure the control register of the corresponding PLL

- a) Calculate the factor N and decimal value X according to the PLL frequency and PLL frequency formula. Refer to the control register of the corresponding PLL (named PLL_xxx_CTRL_REG, where xxx is the module name) in 3.3.6 [Register Description](#) for the corresponding PLL frequency formula.
- b) Write M₀, M₁, N, and PLL frequency to the PLL control register.

- c) Configure the SDM_Enable bit (bit[24]) of the PLL control register to 1 to enable the spread spectrum function.

Step 2 Configure the pattern control register of the corresponding PLL

- a) Calculate the SDM_BOT and WAVE_STEP of the pattern control register according to decimal value X and spread spectrum frequency (the bit[18:17] of the PLL_PAT register)
- b) Configure the spread spectrum mode (SPR_FREQ_MODE) to 2 or 3.
- c) If the PLL_INPUT_DIV2 of the PLL control register is 1, configure the spread spectrum clock source select bit (SDM_CLK_SEL) of the PLL pattern control register to 1. Otherwise, configure SDM_CLK_SEL to the default value 0.
- d) Write SDM_BOT, WAVE_STEP, PREQ, SPR_FREQ_MODE, and SDM_CLK_SEL to the PLL pattern control register, and configure the SIG_DELT_PAT_EN bit (bit[31]) of this register to 1.

Step 3 Delay 20 us**Configuration Example**

The following example shows how to configure the spread spectrum frequency as 605.3 MHz to 609.7 MHz.

If M1 = 0, M0 = 0, P = 1, according to the formula $[f_1, f_2] = (N + 1 + [X_1, X_2]) \cdot 24\text{MHz}$, you can get:

$$\begin{aligned} N + 1 + [X_1, X_2] &= \frac{[605.3, 609.7]}{24} \\ &= \frac{600 + [5.3, 9.7]}{24} \\ &= 24 + 1 + [5.3/24, 9.7/24] \end{aligned}$$

Obviously,

$$N = 24, X_1 = 5.3/24, X_2 = 9.7/24$$

$$\text{SDM_BOT} = 2^{17} * X_1 = 0x7111$$

$$\text{WAVE_STEP} = 2^{17} * (X_2 - X_1) / (24M/\text{PREQ}) * 2 = 0x3f; \text{PREQ} = 31.5 \text{ kHz}$$

If M0 = 1, M1=0, P = 1, then total frequency division factor is $(M0 + 1) * 1 = 2$, so the actual output frequency of PLL is 1212.1 MHz to 1219.4 MHz.

Similarly, you can get:

$$N = 49, X_1 = 12.1/24, X_2 = 19.4/24$$

Then calculate the values of SDM_BOT and WAVE_STEP according to the formulas, and follow the steps described in [Configuration Procedure](#).

3.3.6 Register Description

3.3.6.1 0x0000 PLL_CPU Control Register (Default Value: 0x4A00_1000)

Offset: 0x0000			Register Name: PLL_CPU_CTRL_REG
Bit	Read/Write	Default/Hex	Description
31	R/W	0x0	<p>PLL_EN PLL Enable 0: Disable 1: Enable The PLL_CPU= InputFreq*N.</p> <p>The PLL_CPU output frequency must be in the range from 200 MHz to 3 GHz. And the default value of PLL_CPUX is 408 MHz when the crystal oscillator is 24 MHz.</p>

Offset: 0x0000			Register Name: PLL_CPU_CTRL_REG
Bit	Read/Write	Default/Hex	Description
30	R/W	0x1	PLL_LDO_EN LDO Enable 0: Disable 1: Enable
29	R/W	0x0	LOCK_ENABLE Lock Enable 0: Disable 1: Enable
28	R	0x0	LOCK PLL Lock Status 0: Unlocked 1: Locked (It indicates that the PLL has been stable.)
27	R/W	0x1	PLL_OUTPUT_GATE PLL Output Gating Enable 0: Disable 1: Enable The bit is used to control the output enable of the PLL.
26:24	R/W	0x2	PLL_LOCK_TIME. PLL Lock Time The bit indicates the step amplitude from one frequency to another.
23:16	/	/	/
15:8	R/W	0x10	PLL_N PLL N N= PLL_N +1 PLL_N is from 0 to 254. In application, PLL_N shall be more than or equal to 12.

3.4 BROM System

3.4.1 Overview

The system has several ways to boot. It has an integrated on-chip Boot ROM (BROM) that is considered the primary program-loader. On the startup process, the T113-S3 starts to fetch the first instruction from address 0x0, where is the BROM located at.

The BROM system is divided into two parts: the firmware exchange launch (FEL) module and the Medium Boot module. FEL is responsible for writing the external data to the local NVM, and Medium Boot is responsible for loading an effective and legitimate BOOT0 from NVM and running.

The BROM system includes the following features:

- Supports CPU0 boot process
- Supports mandatory upgrade process through USB and SD card
- Supports GPIO pin and eFuse to select the boot media type
- Supports normal booting and secure booting
- Secure BROM loads only certified firmware
- Secure BROM ensures that the Secure Boot is in a trusted environment

3.4.2 Functional Description

3.4.2.1 Selecting the Boot Medium

The BROM system supports the following boot media:

- SD card
- eMMC
- SPI NOR FLASH
- SPI NAND FLASH

There are two ways to select the boot medium: GPIO Pin Select and eFuse Select. On startup, the BROM will read the state of BOOT_MODE, and decide whether the GPIO or eFuse to select the type of boot medium based on the state of BOOT_MODE. The BOOT_MODE is the bit of the SID module (register: 0x03006210).

The following table shows BOOT_MODE Setting.

Table 3-6 BOOT_MODE Setting

BOOT_MODE	Boot_Select Type
0	GPIO boot select, indicates that the boot medium is decided by the value of the GPIO pin.
1	eFuse boot select, indicates that the boot medium is decided by the value of the eFuse type.

GPIO Boot Select

If the state of the BOOT_MODE is 0, the boot medium is decided by the value of the GPIO pin. The following table shows the boot medium priority. The boot medium priority describes the possibility that each medium to be selected as the boot medium. The BROM reads the boot0 of the medium with the highest priority first. If the medium does not exist or has any problems, the BROM will try the next medium. Otherwise, the medium will be selected as the boot medium.

Table 3-7 GPIO Boot Select Configuration

Pin_Boot_Select[1:0]	Boot Medium Priority
00	SPI NOR->SPI NAND
01	SMHCO->SPI NOR->other media
10	SMHCO->SPI NAND->other media
11	SMHCO->EMMC2_BOOT->EMMC2_USR->other media

The status of the GPIO boot select pin can be read by the bit[12:11] of the system configuration module (register: 0x03000024).

eFuse Boot Select

If the state of the BOOT_MODE is 1, the boot medium is decided by the value of eFuse_Boot_Select_Cfg. The eFuse_Boot_Select_Cfg is divided into 4 groups and each group is 3-bit. The following table shows the groups of eFUSE_Boot_Select.

The status of the efuse boot select pin can be read by the bit[27:16] of the SID module (register: 0x03006210).

Table 3-8 Groups of eFuse_Boot_Select

eFuse_Boot_Select_Cfg[11:0]	Group
eFuse_Boot_Select_Cfg[2:0]	eFuse_Boot_Select_1
eFuse_Boot_Select_Cfg[5:3]	eFuse_Boot_Select_2
eFuse_Boot_Select_Cfg[8:6]	eFuse_Boot_Select_3
eFuse_Boot_Select_Cfg[11:9]	eFuse_Boot_Select_4

The four groups take effect with the following priority:

eFuse_Boot_Select_1 -> eFuse_Boot_Select_2 -> eFuse_Boot_Select_3 -> eFuse_Boot_Select_4

For example, eFuse_Boot_Select_2 will not take effect unless eFuse_Boot_Select_1 is set as 0x111, eFuse_Boot_Select_3 will not take effect unless eFuse_Boot_Select_2 is set as 0x111, and so on.

The following table shows the boot medium priority for the different values of eFuse_Boot_Select_n, where n = [4:1]. The eFuse_Boot_Select_1 to eFuse_Boot_Select_3 are the same setting. But for eFuse_Boot_Select_4, if its value is 0x111, the BROM will select the boot medium in the Try mode. The BROM in the Try mode follows the order below to select the boot medium:

SMHC0 -> SPI NOR -> SPI NAND -> SMHC2

Table 3-9 eFuse Boot Select Setting

eFuse_Boot_Select_n	Boot Medium Priority
000	Select the boot medium in Try mode.
001	Reserved
010	SHMC2
011	SPI NOR
100	SPI NAND
101	Reserved
110	Reserved

eFuse_Boot_Select_n	Boot Medium Priority
111	When n is 1 to 3: The boot medium is decided by the value of eFuse_Boot_Select_(n + 1) . When n is 4: Select the boot medium in Try mode.

3.4.2.2 Selecting the Boot Mode

For SoCs that have implemented and enabled the ARM TrustZone technology, there are two boot modes: Normal BROM Mode and Secure BROM Mode. Secure BROM Mode is designed to protect against the potential threat that attackers modify the code or data areas in programmable memory.

On startup, the BROM will select the boot mode according to the value of the Secure Enable bit. If the value of Secure Enable bit is 0, the system will boot in Normal BROM Mode. Otherwise, it will boot in Secure BROM Mode.

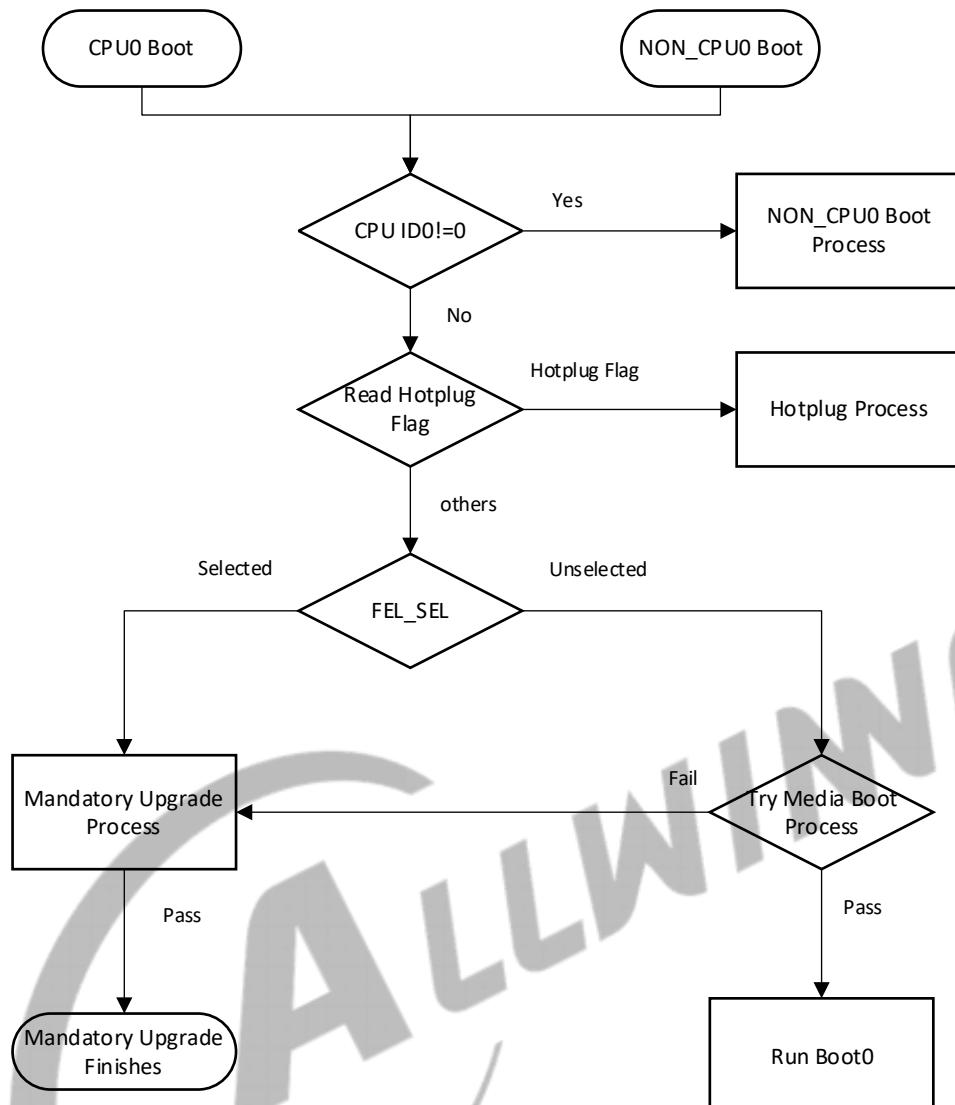

The ARM TrustZone feature is the minimal security functionality an ARM-TrustZone-technology-based system must implement for its Trusted Boot. You can enable the ARM TrustZone feature by configuring the Secure Enable Bit as enabled.

Normal BROM Mode

In Normal BROM Mode, the system boot starts from CPU0, and then the BROM will read the state of the FEL pin. If the FEL pin is high, the system will jump to the fast boot process. If it is low, the system will jump to the mandatory upgrade process.

The following figure shows the boot process in Normal BROM Mode.

Figure 3-6 Boot Process in Normal BROM Mode

Secure BROM Mode

The Secure BROM Mode has the following features:

- Supports X509 certificate

The certificate is used to check whether the Security Boot software is modified or replaced. Before running the Security Boot software, the system checks the integrity of the certificate make sure the software has not been modified or replaced.

- Supports cryptographic algorithms

- SHA-256

- RSA-2048

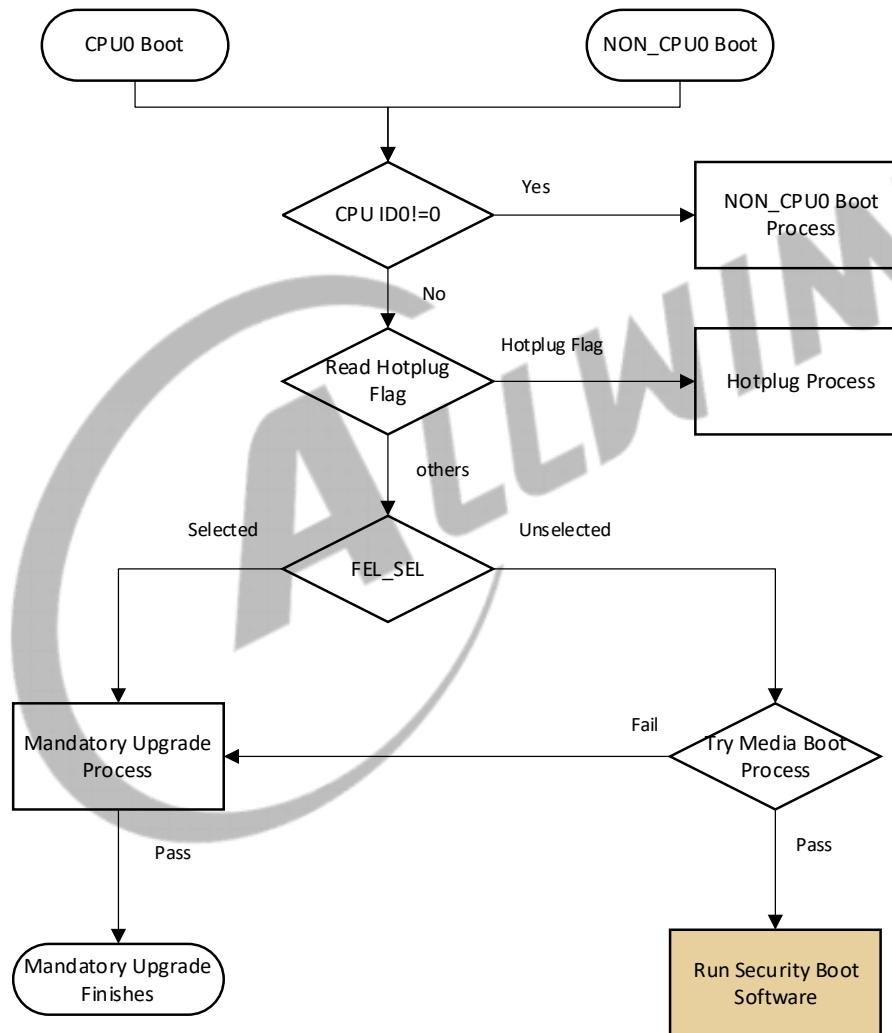

The system uses the Crypto Engine (CE) hardware module to accelerate the speed of encryption and decryption. The use of standard cryptography ensures the reliability of the firmware images. The reliable firmware image ensures that the system security state can be as expected.

- Supports OTP/eFuse

The process of selecting the boot medium in Secure BROM Mode is the same as that in Normal BROM Mode.

In Secure BROM Mode, after the boot medium is selected, the system additionally runs the Security Boot software to authenticate the Sboot bin file.

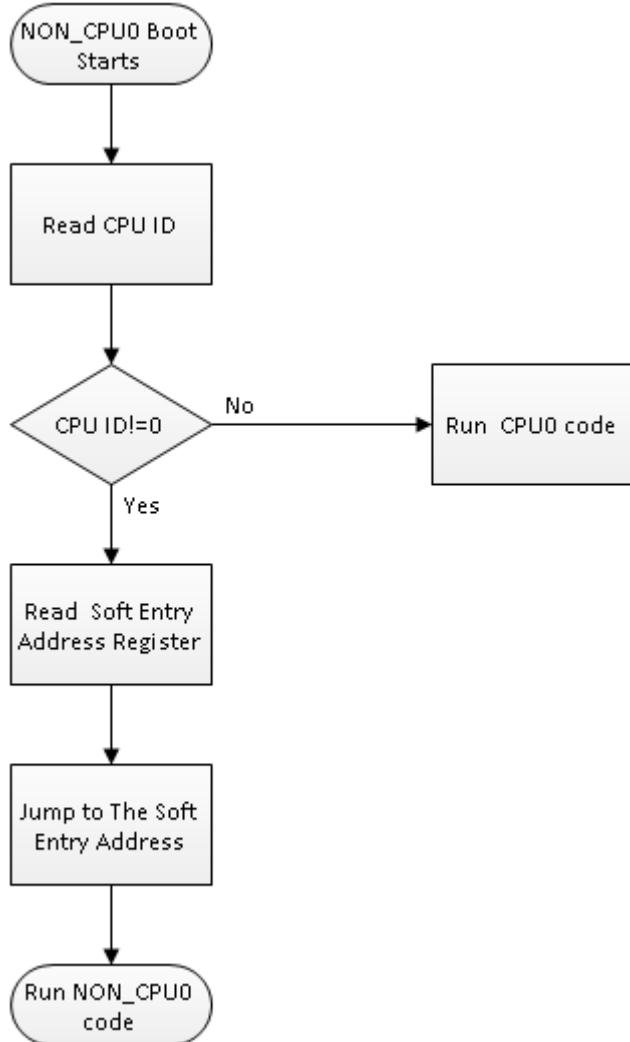

Figure 3-7 Boot Process in Secure BROM Mode

3.4.2.3 NON_CPU0 Boot Process

If CPU ID is greater than 0, the system boot from NON_CPU0, the BROM will read the Soft Entry Address Register, then jump the Soft Entry Address, and run NON_CPU0 boot code. The following figure shows the NON_CPU0 Boot Process.

Figure 3-8 NON_CPU0 Boot Process Diagram

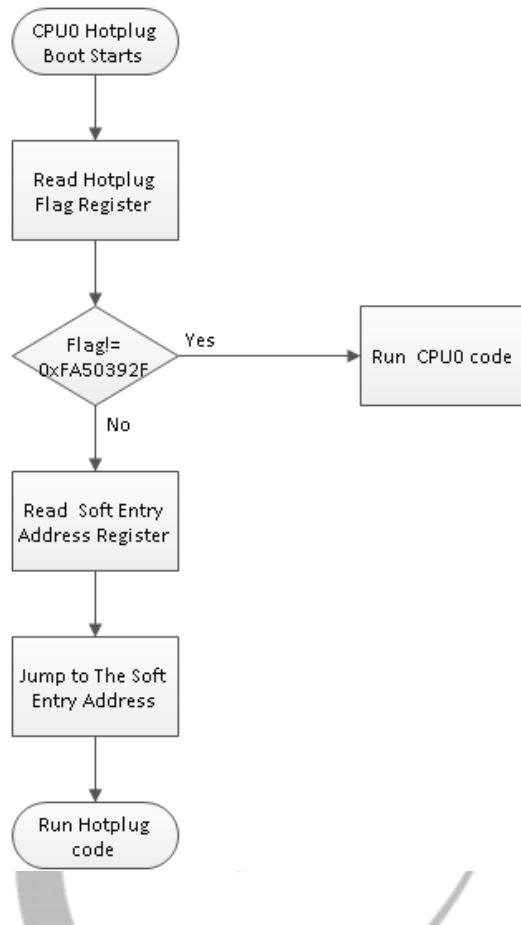

The Soft Entry Address Register of CPU0 is 0x070005C4.

The Soft Entry Address Register of CPU1 is 0x070005C8.

3.4.2.4 CPU0 Hotplug Process

The Hotplug Flag determines whether the system will do Hotplug boot, if the CPU Hotplug Flag value is equal to 0xFA50392F, then read the Soft Entry Register and the system will jump to the Soft Entry Address. The following figure shows the CPU0 Hotplug Process.

Figure 3-9 CPU0 Hotplug Process Diagram

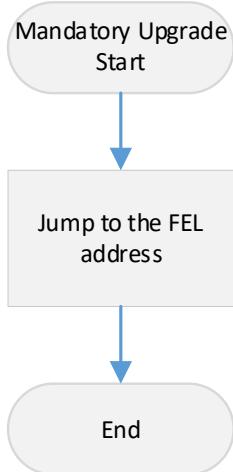

- The Hotplug Flag Register is 0x0700005C0.
- The Soft Entry Address Register is 0x0700005C4.

3.4.2.5 Mandatory Upgrade Process

If the FEL pin is detected to pull low, the system will jump to the mandatory upgrade process. The following figure shows the mandatory upgrade process.

Figure 3-10 Mandatory Upgrade Process

 **NOTE**

- The FEL address of the Normal BROM is 0x20.
- The FEL address of the Secure BROM is 0x64.
- The status of the FEL pin is the bit[8] of the system configuration module (register: 0x03000024).

3.4.2.6 FEL Process

When the system chooses to enter the Mandatory Upgrade Process, the system will jump to the FEL process. The following figure shows the FEL upgrade process.

Figure 3-11 USB FEL Process

3.4.2.7 Fast Boot Process

If the value of the Fast Boot register (0x07090120) in RTC module is not zero, the system will enter the Fast Boot Process. The following table shows the boot medium priority for different values of the Fast Boot register.

Table 3-10 Fast Boot Select Setting

Reg_bit[31:28]	Boot Medium Priority
1	Try process
2	SMHC0->EMMC2_USER->EMMC2_BOOT->Other media
3	SMHC0->SPI NOR->Other media
4	SMHC0->SPI NAND->Other media
5	EMMC2_BOOT->EMMC2_USER->Other media
6	SMHC0->Try process
7	SMHC0->Try process

 **NOTE**

- The bit[28:0] of Fast Boot register is used to record the media information.
- The try process is SMHC0->SPI NOR->SPI NAND->EMMC2_USER->EMMC2_BOOT.

3.6 Timer

3.6.1 Overview

The timer module implements the timing and counting functions. The timer module includes timer0, timer1, watchdog and audio video synchronization (AVS).

The timer0 and timer1 are completely consistent. The main features for timer0 and timer1 are as follows:

- Alternative count clock: LOSC or OSC24M. The LOSC can be either the internal or external low-frequency clock, and the external one has more accuracy.
- Supports 8 prescale factors
- Programmable 32-bit down timer
- Supports two timing modes: periodic mode and single counting mode
- Generates an interrupt when the count is decreased to 0

The watchdog is used to transmit a reset signal to reset the entire system when an exception occurs in the system. The main features for the watchdog are as follows:

- Single clock source: OSC24M/750
- Supports 12 initial values
- Supports the generation of timeout interrupts
- Supports the generation of reset signals
- Supports Watchdog Restart

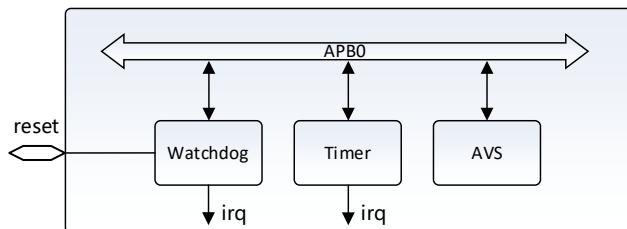

The AVS is used to synchronize the audio and video. The AVS module includes AVS0 and AVS1, which are completely consistent. The main features for the AVS are as follows:

- Single clock source: OSC24M
- Programmable 33-bit up timer
- Supports updating the initial value anytime
- 12-bit frequency divider factor
- Supports Pause/Start function

3.6.2 Block Diagram

The following figure shows the functional block diagram of the timer module.

Figure 3-12 Timer Block Diagram

The watchdog, timer (including timer0 and timer1), and AVS are all mounted at the APB0 bus. The system configures the parameters of these configure registers via APB0 bus.

The timer and watchdog are both down counters and support generating interrupts after the counting value reaches 0.

For watchdog, the system is responsible for configuring the interval value. If the system fails to restart the watchdog regularly because of some exceptional situations, such as the bus hang, the watchdog will send out a Watchdog Reset External signal to reset the system. And the signal will be transmitted to the Reset pad to reset the PMIC.

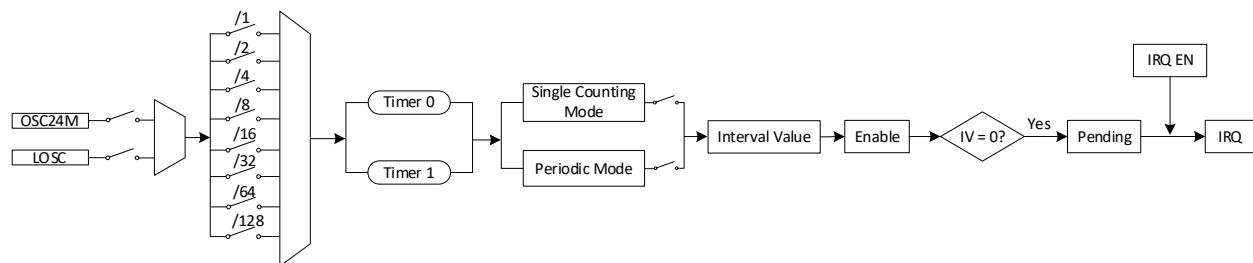

3.6.3 Functional Description

3.6.3.1 Timer

The timer (including timer0 and timer1) is a 32-bit down counter. The counter value is decremented by 1 on each rising edge of the timer clock.

The following figure shows the block diagram for the timer.

Figure 3-13 Block Diagram for the Timer

The clock source for the timer can be either OSC24M or LOSC. For LOSC, it can be either the internal or external low-frequency clock. The external one has more accuracy.

Each timer has a prescale that divides the working clock frequency by 1, 2, 4, 8, 16, 32, 64, or 128. And each timer can generate independent interrupts.

Timing Modes

The timer has two timing modes: the single counting mode and periodic mode. You can configure the timing mode via the bit[7] of [TMRn_CTRL_REG](#) (n = 0 or 1). The value 0 is for the period mode and value 1 is for the single counting mode.

- Single Counting Mode

In the single counting mode, the timer starts counting from the interval value and generates an interrupt after the counter decreases to 0, and then stops counting. It starts to count again only when a new interval value is loaded.

- Periodic Mode

In the periodic mode, the timer restarts another round of counting after generating the interrupt. It reloads data from the [TMRn_INTV_VALUE_REG](#) and then continues to count.

Formula for Calculating the Timer Time

The following formula describes the relationship among timer parameters.

$$T_{\text{timer}} = \frac{\text{TMRn_INTV_VALUE_REG} - \text{TMRn_CUR_VALUE_REG}}{\text{TMRn_CLK_SRC}} \times \text{TMRn_CLK_PRES}$$

Where,

The parameter n is either 0 or 1;

T_{timer} is the remaining time of the timer;

$\text{TMRn_INTV_VALUE_REG}$ is the interval value of the timer;

$\text{TMRn_CUR_VALUE_REG}$ is the current value of the timer;

TMRn_CLK_SRC is the frequency of the timer clock source;

TMRn_CLK_PRES is the prescale ratio of the timer clock.

Initializing the Timer

Follow the steps below to initialize the timer:

1. Configure the timer parameters clock source, prescale factor, and timing mode by writing [TMRn_CTRL_REG](#). There is no sequence requirement of configuring the parameters.

2. Write the interval value.
 - a) Write [TMRn_INTV_VALUE_REG](#) to configure the interval value for the timer.
 - b) Write bit[1] of [TMRn_CTRL_REG](#) to load the interval value to the timer. The value of the bit will be cleared automatically after loading the interval value.
3. Write bit[0] of [TMRn_CTRL_REG](#) to start the timer. To get the current value of the timer, read [TMRn_CUR_VALUE_REG](#).

Processing the Interrupt

Follow the steps below to process the interrupt:

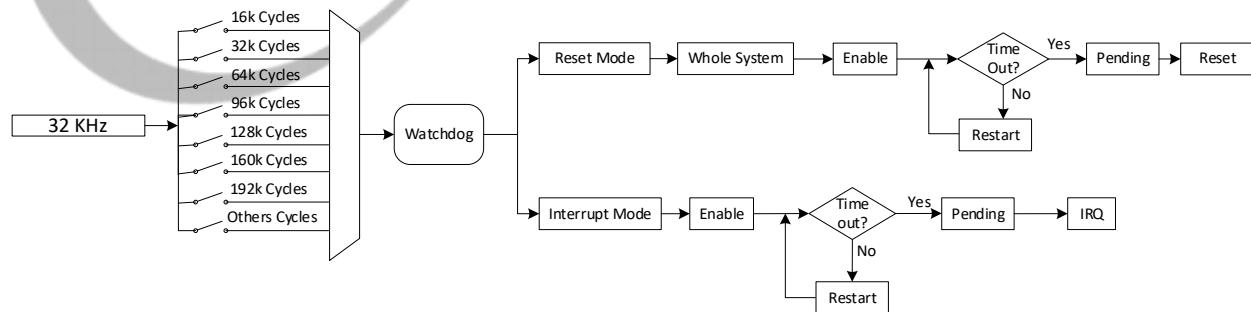

1. Enable interrupts for the timer: write the enable bit of the corresponding interrupt in [TMR IRQ_EN_REG](#) for the timer. The timer will generate an interrupt everytime the count value reaches 0.
2. After entering the interrupt process, write the pending bit of the corresponding interrupt in [TMR IRQ_STA_REG](#) to clear the interrupt pending, and execute the process of waiting for the interrupt.
3. Resume the interrupt and continue to execute the interrupted process.

3.6.3.2 Watchdog

The watchdog is a 32-bit down counter. The counter value is decremented by 1 on each rising edge of the count clock.

The following figure shows the block diagram for the watchdog.

Figure 3-14 Block Diagram for the Watchdog

The clock source of the watchdog is OSC24M/750. There are 12 configurable initial count values.

Operating Modes

The watchdog has two operating modes: the interrupt mode and reset mode.

- In the interrupt mode, when the counter value reaches 0 and WDOG_IRQ_EN_REG is enabled, the watchdog generates an interrupt.
- In the reset mode, when the counter value reaches 0, the watchdog generates a reset signal to reset the entire system.

You can configure the operating mode for the watchdog via the bit[1:0] of the WDOG_CFG_REG. The value 0x2 is for the interrupt mode and the value 0x1 is for the reset mode.

Both the interrupt mode and reset mode support Watchdog Restart. You can make the watchdog to count from the initial value at any time by configuring the WDOG_CTRL_REG: write 0xA57 to bit[12:1], then write 1 to bit[0].

Initializing the Watchdog

Follow the steps below to initialize the watchdog:

1. Write the bit[1:0] of [WDOG_CFG_REG](#) to configure the watchdog operating mode so that the watchdog can generate interrupts or output reset signals.
2. Write the bit[7:4] of [WDOG_MODE_REG](#) to configure the initial count value.
3. Write the bit[0] of [WDOG_MODE_REG](#) to enable the watchdog.

Processing the Interrupt

In the interrupt mode, the watchdog is used as a counter. It generates an interrupt everytime the count value reaches 0.

Follow the steps below to process the interrupt:

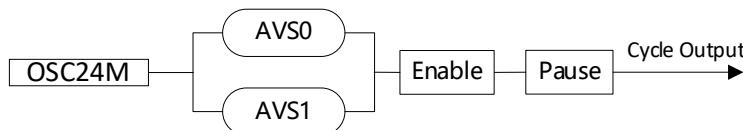

1. Write the enable bit of [WDOG_IRQ_EN_REG](#) to enable the interrupt.
2. After entering the interrupt process, write the pending bit of [WDOG_IRQ_STA_REG](#) to clear the interrupt pending and execute the process of waiting for the interrupt.
3. Resume the interrupt and continue to execute the interrupted process.

3.6.3.3 AVS

The AVS is a 33-bit up counter. The counter value is increased by 1 on each rising edge of the count clock. There is a clock gate in [CCU](#) module to control the output of the AVS counter. To operate the AVS, open the clock gate first.

The following figure shows the block diagram for the AVS.

Figure 3-15 Block Diagram for the AVS

The clock source of the AVS is OSC24M. There is a 12-bit division factor for each AVS, N0 for AVS0 and N1 for AVS1. When the timer increases from 0 to N1 or N2, the AVS counter adds 1. When the counter reaches 33-bit upper limit, the AVS will start to count from the initial value again.

The AVS supports changing the initial value and division factor at anytime. And the AVS supports restarting from the initial value or pausing at anytime.

Starting or Pausing the AVS

Follow the steps below:

1. Write [AVS_CNT_DIV_REG](#) to configure the division factor.
2. Write [AVS_CNTn_REG](#) (n = 0 or 1) to configure the initial value.
3. Write [AVS_CNT_CTL_REG](#) to enable the AVS. You can pause the AVS at any time.

3.6.4 Programming Guidelines

3.6.4.1 Configuring the Timer

The following example shows how to make a one-millisecond delay with the clock source selected as OSC24M, the operating mode sets as single counting mode, and the pre-scale sets as 2.

```
writel(0x2EE0, TMR_0_INTV);           //Set the interval value  
writel(0x94, TMR_0_CTRL);            //Select Single mode, 24 MHz clock source, 2 pre-scale  
writel(readl(TMR_0_CTRL)|(1<<1), TMR_0_CTRL); //Set the Reload bit  
while((readl(TMR_0_CTRL)>>1)&1);      //Waiting the Reload bit turns to 0
```

```
writel(readl(TMR_0_CTRL)|(1<<0), TMR_0_CTRL); //Enable Timer0
```

3.6.4.2 Resetting the Watchdog

The following example shows how to make the watchdog to generate a reset signal to the whole system after 1 second. The clock source for the watchdog is OSC24M/750.

```
writel(0x1, WDOG_CONFIG); //Set the operating mode as the reset mode.  
writel(0x10, WDOG_MODE); //Set the interval value as 1 s.  
writel(readl(WDOG_MODE)|(1<<0), WDOG_MODE); //Enable the Watchdog.
```

3.6.4.3 Restarting the Watchdog

The following example shows how to restart the watchdog. In this example, the clock source is OSC24M/750, the interval value is 1 second, and the watchdog operating mode is the reset mode.

If the execution time of “other codes” is shorter than 1 second, the watchdog will restart from the interval value before it count to zero and generates the reset signal. Otherwise, the watchdog will reset the whole system before the code “writel(readl(WDOG_CTRL)|(0xA57<<1)|(1<<0), WDOG_CTRL)” is executed.

```
writel(0x1, WDOG_CONFIG); //To whole system  
writel(0x10, WDOG_MODE); //Interval Value set 1s  
writel(readl(WDOG_MODE)|(1<<0), WDOG_MODE); //Enable Watchdog  
----other codes---  
writel(readl(WDOG_CTRL)|(0xA57<<1)|(1<<0), WDOG_CTRL); //Write 0xA57 at Key Field and Restart Watchdog
```

3.7 High Speed Timer

3.7.1 Overview

The high speed timer (HSTimer) module consists of HSTimer0 and HSTimer1. HSTimer0 and HSTimer1 are down counters that implement timing and counting functions. They are completely consistent. Compared with the timer module, the HSTimer module provides more precise timing and counting.

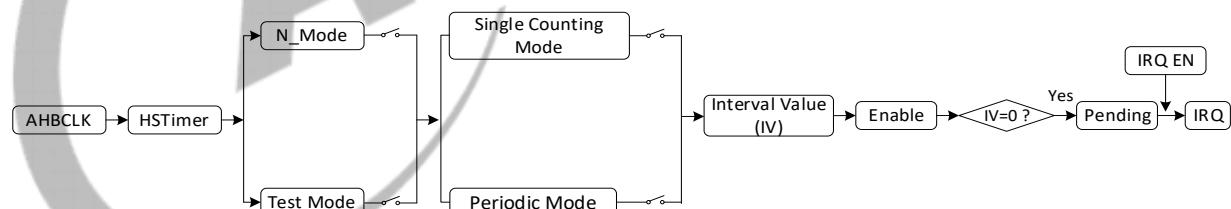

The HSTimer has the following features:

- Single clock source: AHB0
- Supports 5 prescale factors
- Configurable 56-bit down timer
- Supports 2 timing modes: periodic mode and one-shot mode
- Supports the test mode
- Generates an interrupt when the count is decreased to 0

3.7.2 Block Diagram

The following figure shows the block diagram of the HSTimer.

Figure 3-16 HSTimer Block Diagram

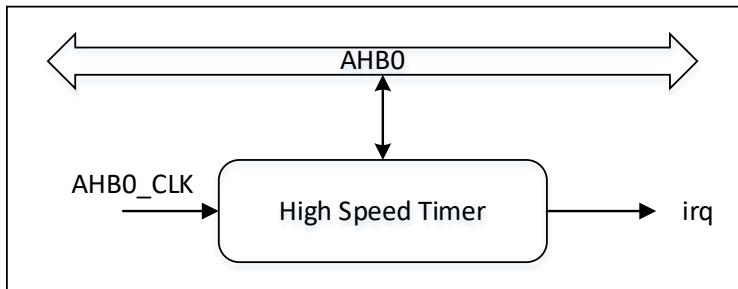

3.7.3 Functional Description

The HSTimers are 56-bit down counters. The counter value is decremented by 1 on each rising edge of the count clock. Each HSTimer has a prescaler that divides the working clock frequency of each working timer by 1, 2, 4, 8, or 16.

3.7.3.1 Typical Application

The following figure shows a typical application of HSTimer module.

Figure 3-17 Typical Application for HSTimer

The HSTimer module is mounted at AHBO, and can control the registers via AHBO. AHBO is the clock source of the HSTimer. When the count value reaches zero, the HSTimer generates an interrupt.

3.7.3.2 Count Modes

The HSTimer has two count modes: one-shot mode and periodic mode. You can configure the timing mode via the bit[7] of [HS_TMRn_CTRL_REG](#) ($n = 0$ or 1). The value 0 is for the period mode and value 1 is for the one-shot mode.

- One-shot Mode

When the count value of the HSTimer reaches 0, the HSTimer stops counting. The HSTimer starts to count again only when a new value is loaded.

- Periodic Mode

The HSTimer counts continuously. When the count value of the HSTimer reaches 0, the HSTimer reloads an initial value from [HS_TMRn_INTV_LO_REG](#) and [HS_TMRn_INTV_HI_REG](#) and then continues to count.

3.7.3.3 Operating Modes

The HSTimer has two operating modes: the normal mode and test mode. You can configure the operating mode via the bit[31] of [HS_TMRn_CTRL_REG](#). The value 0 is for the normal mode and value 1 is for the test mode.

- Normal Mode

In the normal mode, the HSTimer is used as a 56-bit down counter, which can finish one-shot counting and periodic counting. The interval value for the HSTimer consists of two parts: [HS_TMRn_INTV_LO_REG](#) forms the bit[31:0] and [HS_TMRn_INTV_HI_REG](#) forms the bit[55:32]. To read or write the interval value, [HS_TMRn_INTV_LO_REG](#) should be done before [HS_TMRn_INTV_HI_REG](#).

- Test Mode

In the test mode, the HSTimer is used as a 24-bit down counter. [HS_TMRn_INTV_LO_REG](#) must be set to 0x1, and [HS_TMRn_INTV_HI_REG](#) acts as the initial value for the HSTimer.

3.7.3.4 HSTimer Formula

The following formula describes the relationship among HSTimer parameters in the normal mode.

$$T_{HSTimer} = \frac{(HS_TMRn_INTV_HI_REG << 32 + HS_TMRn_INTV_LO_REG) - (HS_TMRn_CURNT_HI_REG << 32 + HS_TMRn_CURNT_LO_REG)}{AHB0CLK} \times HS_TMRn_CLK$$

Where,

The parameter n is either 0 or 1;

$T_{HSTimer}$ is the remaining time of the timer;

$HS_TMRn_INTV_HI_REG$ is bit[55:32] of the HSTimer interval value;

$HS_TMRn_INTV_LO_REG$ is bit[31:0] of the HSTimer interval value;

$HS_TMRn_CURNT_HI_REG$ is bit[55:32] of the HSTimer current value;

$HS_TMRn_CURNT_LO_REG$ is bit[31:0] of the HSTimer current value;

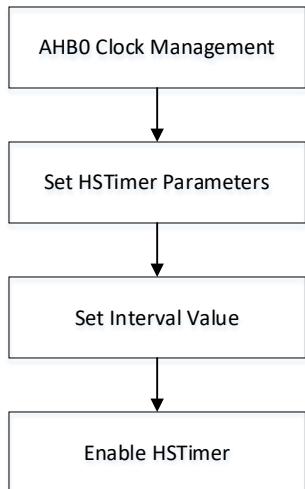

AHB0CLK is the frequency of AHB0 Clock (the HSTimer clock source);

HS_TMRn_CLK is the prescale ratio of the HSTimer clock.

3.7.3.5 Initializing the HSTimer

The following figure shows the process of HSTimer initialization.

Figure 3-18 HSTimer Initialization Process

1. AHBO clock management: Open the clock gate of AHBO and de-assert the soft reset of AHBO in CCU.
2. Configure the corresponding parameters of the HSTimer: clock source, prescaler factor, operating mode, and timing mode. There is no sequence requirement when writing the above parameters to [HS_TMRn_CTRL_REG](#).
3. Write the initial value: Write the lower 32 bits of the initial value to [HS_TMRn_INTV_LO_REG](#) first, and then the higher 24 bits to [HS_TMRn_INTV_HI_REG](#). Normally, write the bit[1] of [HS_TMRn_CTRL_REG](#) to load the initial value. If the HSTimer is in the timing stop stage, write 1 to the bit[1] and bit[0] of [HS_TMRn_CTRL_REG](#) at the same time to reload the initial value.
4. Enable HSTimer: Write the bit[0] of [HS_TMRn_CTRL_REG](#) to enable HSTimer to count.
5. Reading [HS_TMRn_CURNT_LO_REG](#) and [HS_TMRn_CURNT_HI_REG](#) can get current counting value.

3.7.3.6 Processing the HSTimer Interrupt

Follow the steps below to process the HSTimer interrupt:

1. Enable interrupt: Write the corresponding interrupt enable bit of [HS_TMR_IRQ_EN_REG](#), when the counting time of HSTimer reaches, the corresponding interrupt generates.
2. After entering the interrupt process, write [HS_TMR_IRQ_STAS_REG](#) to clear the interrupt pending.
3. Resume the interrupt and continue to execute the interrupted process.

3.7.4 Programming Guidelines

The following example shows how to make a 1 us delay with HSTimer0. The frequency of the AHB0 clock is 100 MHz, the operating mode is the normal mode, the timing mode is single counting mode, and the pre-scale is 2.

```
writel(0x32, HS_TMR0_INTV_LO);           //Set bit[31:0] of the interval value as 0x32.  
writel(0x0, HS_TMR0_INTV_HI);           //Set bit[55:32] of the interval value as 0x0.  
  
writel(0x90, HS_TMR0_CTRL);  
  
//Set the operating mode as Normal Mode, the pre-scale as 2, and the timing mode as Single Counting Mode.  
  
writel(readl(HS_TMR0_CTRL)|(1<<1), HS_TMR0_CTRL); //Set the reload bit.  
  
writel(readl(HS_TMR0_CTRL)|(1<<0), HS_TMR0_CTRL); //Enable HSTimer0.  
  
while(!(readl(HS_TMR_IRQ_STAS)&1));          //Wait for HSTimer0 to generate pending.  
  
writel(1, HS_TMR_IRQ_STAS);                  //Clear HSTimer0 pending.
```

HSTimer1 is a 56-bit counter. The interval value consists of two parts: HS_TMR1_INTV_VALUE_LO acts as the bit[31:0] and HS_TMR1_INTV_VALUE_HI acts as the bit[55:32]. To read or write the interval value, HS_TMR1_INTV_LO_REG should be done before HS_TMR1_INTV_HI_REG.

3.7.6.11 0x004C HS Timer1 Current Value Lo Register (Default Value: 0x0000_0000)

Offset: 0x004C			Register Name: HS_TMR1_CURNT_LO_REG
Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	HS_TMR1_CUR_VALUE_LO Bit[31:0] of the HSTimer1 current value

3.7.6.12 0x0050 HS Timer1 Current Value Hi Register (Default Value: 0x0000_0000)

Offset: 0x0050			Register Name: HS_TMR1_CURNT_HI_REG
Bit	Read/Write	Default/Hex	Description
31:24	/	/	/
23:0	R/W	0x0	HS_TMR1_CUR_VALUE_HI Bit[55:32] of the HSTimer1 current value

**NOTE**

HSTimer1 is a 56-bit counter. The current value consists of two parts: HS_TMR1_CUR_VALUE_LO acts as the bit[31:0] and HS_TMR1_CUR_VALUE_HI acts as the bit[55:32]. To read or write the current value, HS_TMR1_CUR_VALUE_LO should be done before HS_TMR1_CUR_VALUE_HI.

3.8 Generic Interrupt Controller (GIC)

3.8.1 Overview

The GIC-400 is a high-performance, area-optimized interrupt controller with an Advanced Microcontroller Bus Architecture (AMBA) Advanced eXtensible Interface (AXI) interface. It detects, manages, and distributes interrupts in System on Chip (SoC) configurations. You can configure the GIC-400 to provide the optimum features, performance, and gate count required for your intended application.

For details about GIC, please refer to the [GIC PL400 technical reference](#) manual and [ARM GIC Architecture Specification V2.0](#).

3.8.2 Functional Description

The following table describes the details of interrupt sources.

CAUTION

The CPU interrupt seen by DSP is subtracted 32 from the following interrupt number. For example, the interrupt number of MSGBOX is 32, then the interrupt number seen by DSP is 0.

3.9 Direct Memory Access Controller (DMAC)

3.9.1 Overview

The direct memory access (DMA) is a method of transferring data between peripherals and memories (including the SRAM and DRAM) without using the CPU. It is an efficient way to offload data transfer duties from the CPU. Without DMA, the CPU has to control all the data transfers. While with DMA, the DMAC directly transfers data between a peripheral and a memory, between peripherals, or between memories.

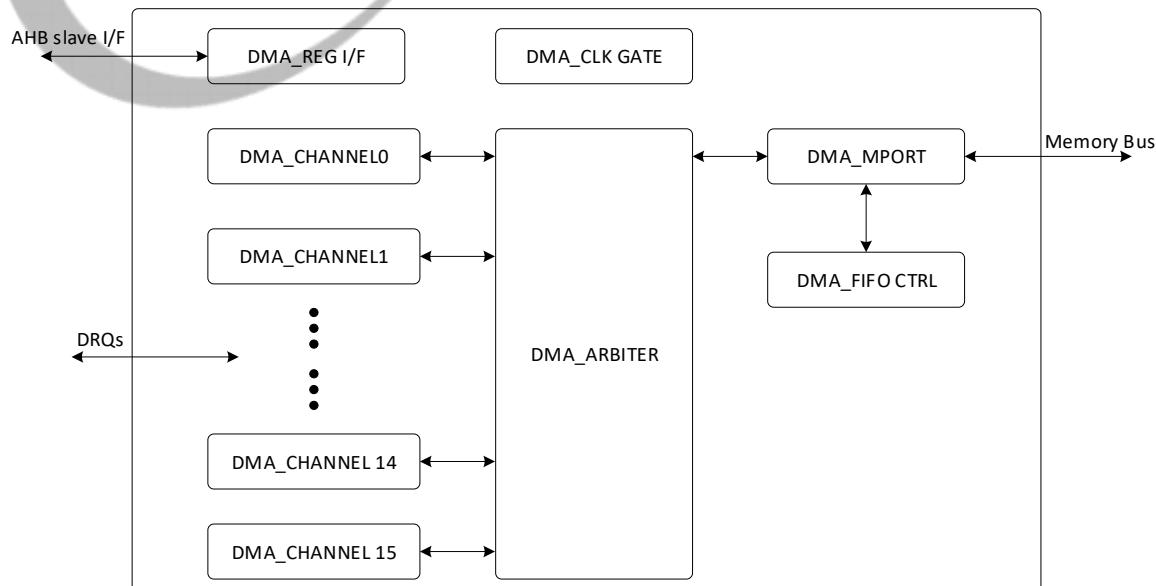

The DMAC has the following features:

- Up to 16 DMA channels
- Provides 32 peripheral DMA requests for data reading and 32 peripheral DMA requests for data writing
- Supports transferring data with a linked list
- Supports programmable 8-bit, 16-bit, 32-bit, and 64-bit data width
- Supports programmable DMA burst length
- DRQ response includes the waiting mode and handshake mode
- DMA channel supports pause function
- Memory devices support non-aligned transform

3.9.2 Block Diagram

The following figure shows a block diagram of DMAC.

Figure 3-19 DMAC Block Diagram

DMAC contains the following sub-blocks:

Table 3-12 DMAC Sub-blocks

Sub-block	Description
DMA_ARBITER	Arbitrates the DMA read/write requests from all channels, and converts the requests to the read/write requests of ports.
DMA_CHANNELS	DMA transfer engine. Each channel is independent. When the DMA requests from multiple peripherals are valid simultaneously, the channel with the highest priority starts data transfer first. The system uses the polling mechanism to decide the priorities of DMA channels. When DMA_ARBITER is idle, channel 0 has the highest priority, whereas channel 15 has the lowest priority. When DMA_ARBITER is busy processing the request from channel n, channel (n+1) has the highest priority. For n = 15, the channel (n + 1) should be channel 0.
DRQs	DMA requests. Peripherals use the DMA request signals to request a data transfer.
DMA_MPORT	Receives the read/write requests from DMA_ARBITER, and converts the requests to the corresponding MBUS access requests. It is mainly used for accessing the DRAM.
DMA_HPORT	The port for accessing the AHB Master. It is mainly used for accessing the SRAM and IO devices.
DMA_FIFO CTRL	Internal FIFO cell control module.
DMA_REG Interface	DMA_REG is the common register module that is mainly used to resolve AHB demands.
DMA_CLKGATE	The control module for hardware auto clock gating.

The DMAC integrates 16 independent DMA channels and each channel has an independent FIFO controller. When the DMA channel starts, the DMAC gets a DMA descriptor from the DMA_DESC_ADDR_REG and uses it as the configuration information for the data transfer of the current DMA package. Then the DMAC can transfer data between the specified devices. After transferring a DMA package, the DMAC judges if the current channel transfer is finished via the linked address in the descriptor. If the linked address shows all the packages are transferred, the DMAC will end the chain transmission and close the channel.

3.9.3 Functional Description

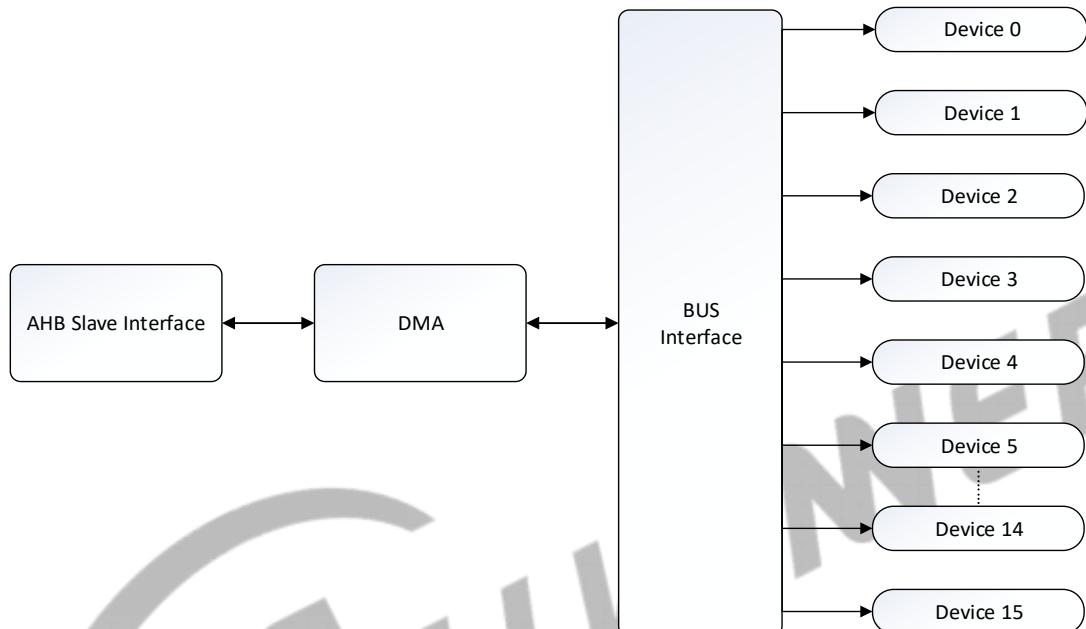

3.9.3.1 Clock

The DMAC is on MBUS. The clock of MBUS influences the transfer efficiency of the DMAC.

3.9.3.4 DMA Descriptor

The DMAC descriptor is the configuration information of DMA transfer that decides the DMA working mode. Each descriptor includes 6 words: Configuration, Source Address, Destination Address, Byte Counter, Parameter, and Link. The following figure shows the structure of the DMA descriptor.

Figure 3-21 DMA Descriptor

- **Configuration:** Configure the following information by DMA_CFG_REG.
 - DRQ type: DRQ type of the source and destination devices.
 - Address counting mode: For both the source and destination devices, there are two address counting modes: the IO mode and linear mode. The IO mode is for IO devices whose address is fixed during the data transfer and the linear mode is for the memory whose address is increasing during the data transfer.

- Transferred block length: The amount of data that non-memory peripherals can transfer in a valid DRQ. The block length supports 1 bit, 4 bits, 8 bits, and 16 bits.
- Transferred data width: The data width of operating the non-memory peripherals. The data width supports 8 bits, 16 bits, 32 bits, and 64 bits.

 **NOTE**

The configuration supports BMODE mode. The BMODE is used in the following scenario: the source is an IO device, and the destination is a memory device. Setting the BMODE mode can limit the amount of block data transferred in DMA block transmission to the amount of data transferred when the DRQ threshold of the source IO device is 1. For example,

- **Source Address:** Configure the address of the source device.
- **Destination Address:** Configure the address of the destination device.

DMA reads data from the source address and then writes data to the destination address.

Both the DMA source and destination addresses have 34 bits. In the descriptor, because there are only 32 bits in the **Source/Destination Address** field, another 2 bits are stored in the **Parameter** field.

The following table shows the details of the related fields in the descriptor.

Table 3-14 Source/Destination Address Distribution

Descriptor Group	Bit	Description
Source Address	31:0	DMA transfers the lower 32 bits of the 34-bit source address
Destination Address	31:0	DMA transfers the lower 32 bits of the 34-bit destination address
Parameter	31:20	Reserved
	19:18	DMA transfers the higher 2 bits of the 34-bit destination address
	17:16	DMA transfers the high 2 bits of the 34-bit source address
	15:8	Reserved
	7:0	Wait Clock Cycles Set the waiting time in DRQ mode
Link	31:2	The address of the next group descriptor, the lower 30 bits of the word address
	1:0	The address of the next group descriptor, the higher 2 bits of the word address

From the above table, you can get:

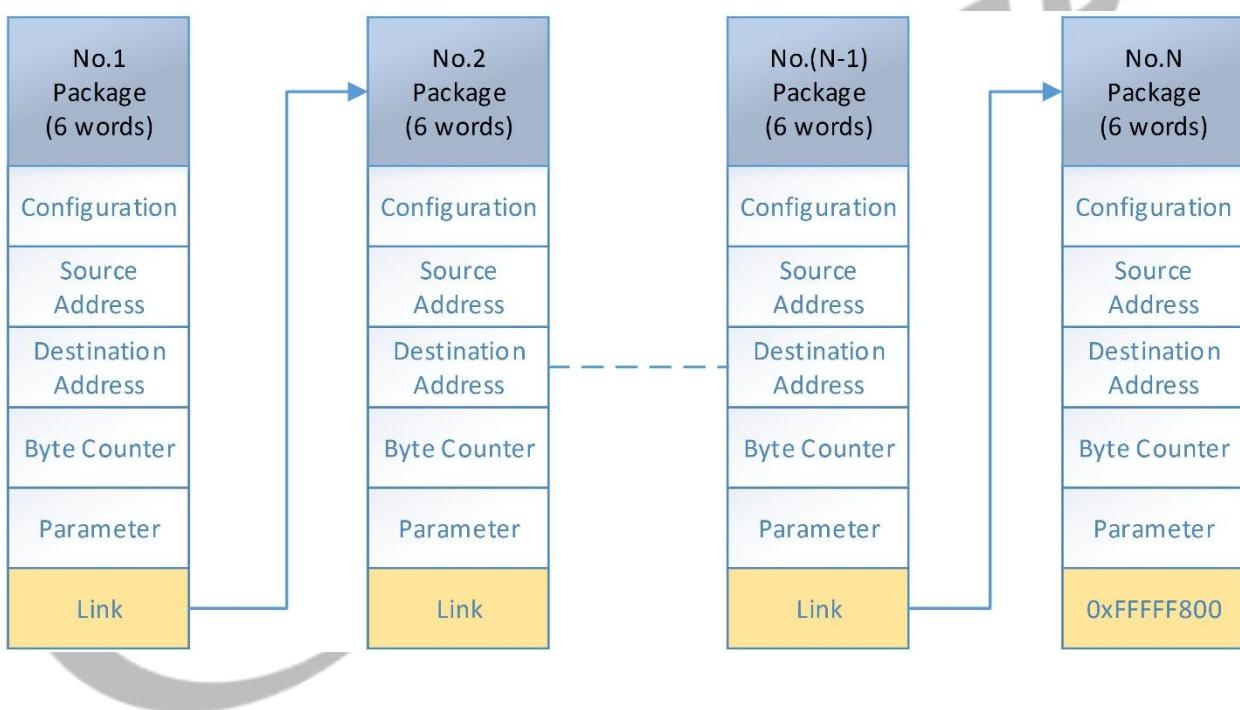

Real DMA source address (in byte mode) = {Parameter [17:16], Source Address [31:0]};

Real DMA destination address (in byte mode) = {Parameter [19:18], Destination Address [31:0]};

Real link address (in byte mode) = {Link[1:0], Link[31:2], 2'b00}.

- **Byte counter:** Configure the data amount of a package. The maximum value is (2²⁵-1) bytes. If the data amount of the package reaches the maximum value, even if DRQ is valid, the DMA will stop the current transfer.
- **Parameter:** Configure the interval between the data block. The parameter is valid for non-memory peripherals. When DMA detects that the DRQ is high, the DMA transfers the data block and ignores the status changes of the DRQ until the data transfer finishes. After that, the DMA waits for certain clock cycles (WAIT_CYC) and executes the next DRQ detection.
- **Link:** If the value of the link is 0xFFFF800, the current package is at the end of the linked list. The DMAC will stop the data transfer after transferring the package; otherwise, the value of the link is considered as the descriptor address of the next package.

Figure 3-22 DMA Chain Transfer

3.9.3.5 Interrupts

There are three kinds of DMA interrupts: the half package interrupt, package end interrupt, and queue end interrupt.

Half package interrupt: When enabled, the DMAC sends out a half package interrupt after transferring half of a package.

Package end interrupt: When enabled, the DMAC sends out a package end interrupt after transferring a complete package.

Queue end interrupt: When enabled, the DMAC sends out a queue end interrupt after transferring a complete queue.

Notice that when CPU does not respond to the interrupts timely, or two DMA interrupts are generated very closely, the later interrupt may override the former one. That is, from the perspective of the CPU, the DMAC has only a system interrupt source.

NOTE

The DMAC has 16 channels and 2 groups of interrupts. The channel [7:0] corresponds to one group of interrupt, the channel [15:8] corresponds to another group of interrupt. The DSP is fixed to use the interrupt of the channel [15:8].

3.9.3.6 Clock Gating

The DMA_CLK_GATE module is a hardware module for controlling the clock gating automatically. It provides clock sources for sub-modules in DMAC and the module local circuits.

The DMA_CLK_GATE module consists of two parts: the channel clock gate and the common clock gate.

Channel clock gate: Controls the DMA clock of the DMA channels. When the system accesses the register of the current DMA channel and the DMA channel is enabled, the channel clock gate automatically opens the DMA clock. With a 16-HCLK-cycle delay after the system finishes accessing the register or the DMA data transfer is completed, the channel clock gate automatically closes the DMA clock. Also, the clock for the related circuits, such as for the channel control and FIFO control modules, will be closed.

Common clock gate: Controls the clocks of the DMA common circuits. The common circuits include the common circuit of the FIFO control module, MPORT module, and MBUS. When all the DMA channels are enabled, the common clock gate automatically closes the clocks for the above circuits.

The DMA clock gating can support all the functions stated above or not by software.

3.9.3.7 Transfer Mode

The peripherals initiate data transfer by transmitting DMA request signals to the DMAC. After receiving the request signal, the DMAC converts it to the internal DRQ signal and controls the DMA data transfer.

The DMAC supports two data transfer modes: the waiting mode and handshake mode.

The principle of waiting mode

- When the DMAC detects a valid external request signal, the DMAC starts to operate the peripheral device. The internal DRQ always holds high before the transferred data amount reaches the transferred block length.
- When the transferred data amount reaches the transferred block length, the internal DRQ pulls low automatically.
- The internal DRQ holds low for certain clock cycles (WAIT_CYC), and then the DMAC restarts to detect the external requests. If the external request signal is valid, then the next transfer starts.

The principle of handshake mode

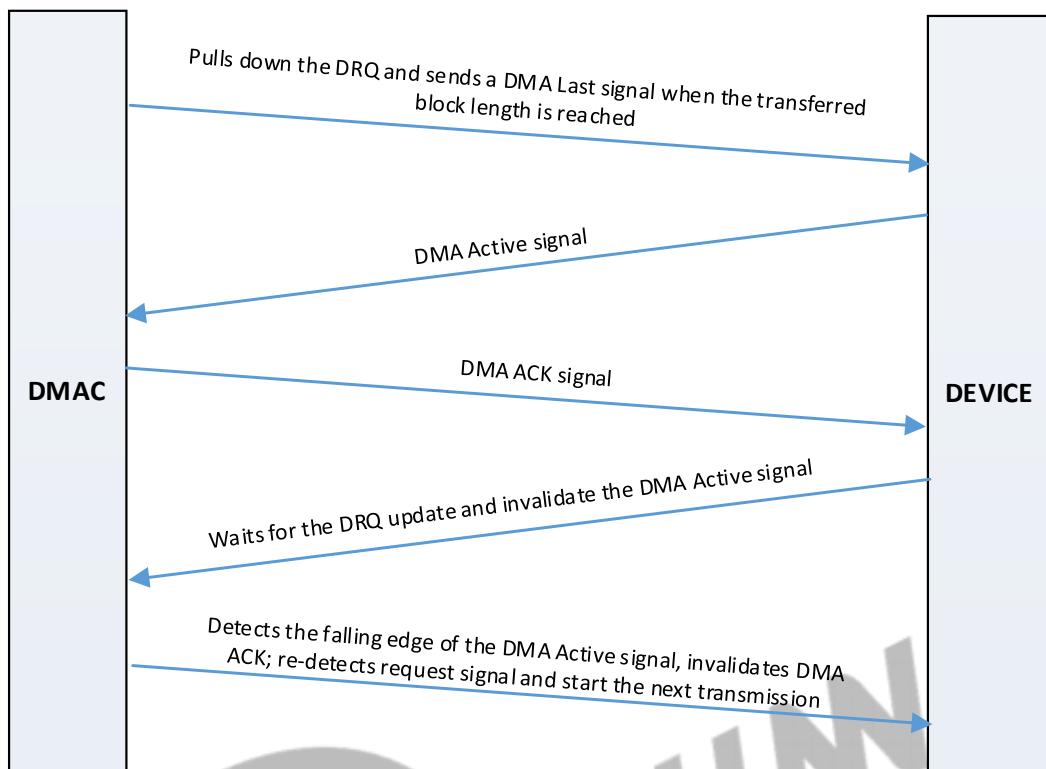

- When the DMAC detects a valid external request signal, the DMAC starts to operate the peripheral device. The internal DRQ always holds high before the transferred data amount reaches the transferred block length.
- When the transferred data amount reaches the transferred block length, the internal DRQ will be pulled down automatically. For the last data transfer of the block, the DMAC sends a DMA Last signal with the DMA commands to the peripheral device. The DMA Last signal will be packed as part of the DMA commands and transmitted on the bus. It is used to inform the peripheral device that it is the end of the data transfer for the current DRQ.
- When the peripheral device receives the DMA Last signal, it can judge that the data transfer for the current DRQ is finished. To continue the data transfer, it sends a DMA Active signal to the DMAC.

One DMA Active signal will be converted to one DRQ signal in the DMA module. To generate multiple DRQs, the peripheral device needs to send out multiple DMA Active signals via the bus protocol.

- When the DMAC received the DMA Active signal, it sends back a DMA ACK signal to the peripheral device.
- When the peripheral device receives the DMA ACK signal, it waits for all the operations on the local device completed, and both the FIFO and DRQ status refreshed. Then it invalidates the DMA Active signal.
- When the DMAC detects the falling edge of the DMA Active signal, it invalidates the corresponding DMA ACK signal, and restarts to detect the external request signals. If a valid request signal is detected, the next data transfer starts.

The following figure shows the workflow of the handshake mode.

Figure 3-23 Workflow of the DMAC Handshake Mode

3.9.3.8 Address Auto-Alignment

For the non-IO devices whose start address is not 32-byte-aligned, the DMAC will adjust the address to 32-byte-aligned through the burst transfer within 32 bytes. Adjusting address to 32-byte-aligned improves the DRAM access efficiency.

The following example shows how the DMAC adjusts the address: when the peripheral device of a DMA channel is a non-IO device whose start address is 0x86 (not 32-byte-aligned), the DMAC firstly uses a 26-byte burst transfer to align the address to 0xA0 (32-byte-aligned), and then transfers data by 64-byte burst (the maximum transfer amount that MBUS allows).

The IO devices do not support address alignment, so the bit width of IO devices must match the address offset; otherwise, the DMAC will ignore the inconsistency and directly transmit data of the corresponding bit width to the address.

The address of the DMA descriptor does not support the address auto-alignment. Make sure the address is word-aligned; otherwise the DMAC cannot identify the descriptor.

3.9.3.9 DMAC Clock Control

- The DMAC clock is synchronous with the AHB0 clock. Make sure that the DMAC gating bit of AHB0 clock is enabled before accessing the DMAC register.
- The reset input signal of the DMAC is asynchronous with AHB0 and is low valid by default. Make sure that the reset signal of the DMAC is de-asserted before accessing the DMA register.
- To avoid the indefinite state within registers, de-assert the reset signal first, and then open the gating bit of AHB0.
- The DMAC supports Clock Auto Gating function to reduce power consumption, the system will automatically disable the DMAC clock in the DMAC idle state. Clock Auto Gating is enabled by default.

3.9.4 Programming Guidelines

3.9.4.1 Using DMAC Transfer Process

The DMAC transfer process is as follows.

Step 1 Request DMA channel, and check if the DMA channel is idle by checking if it is enabled. A disabled channel indicates it is idle, while an enabled channel indicates it is busy.

Step 2 Write the descriptor with 6 words into the memory. The descriptor must be word-aligned. For more details, refer to section 3.9.3.4 “[DMA Descriptor](#)”.

Step 3 Write the start address of the descriptor to [DMA DESC ADDR REGN](#).

Step 4 Enable the DMA channel, and write the corresponding channel to [DMAC EN REGN](#).

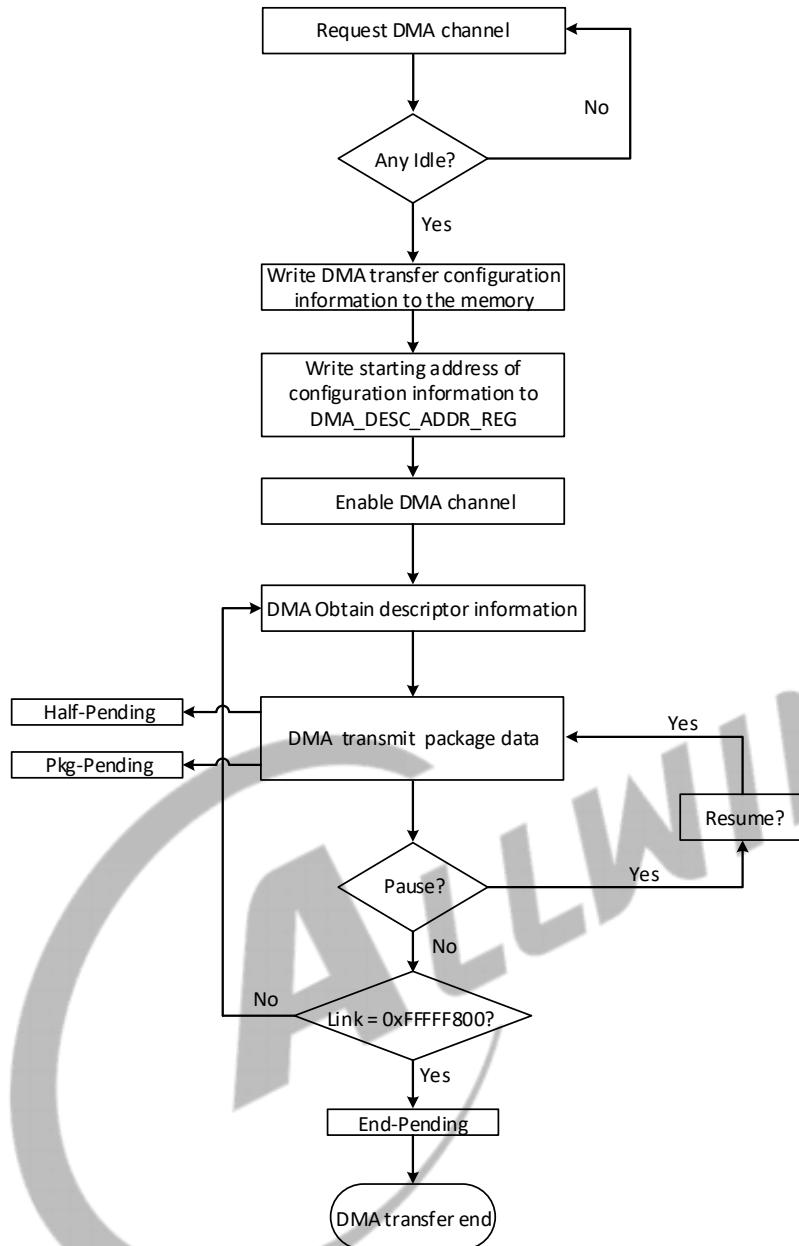

Step 5 The DMA obtains the descriptor information.

Step 6 Start to transmit a package. When half of the package is completed, the DMA sends a Half Package Transfer Interrupt; when a total package is completed, the DMA sends a Package End Transfer Interrupt. These interrupt status can be read by [DMAC IRQ PEND REGO](#).

Step 7 Set [DMAC PAU REGN](#) to pause or resume the data transfer.

Step 8 After completing a total package transfer, the DMA decides to start the next package transfer or end the transfer by the link of the descriptor. If the link is 0xFFFFF800, the transfer ends; otherwise, the next package starts to transmit. When the transfer ends, the DMA sends a Queue End Transfer Interrupt.

Step 9 Disable the DMA channel.

Figure 3-24 DMAC Transfer Process

3.9.4.2 Processing DMAC Interrupt

Follow the steps below to process the DMAC interrupt:

- Step 1** Enable interrupt: write the corresponding interrupt enable bit of [DMAC_IRQ_EN_REG0](#). The system generates an interrupt when the corresponding condition is satisfied.
- Step 2** After entering the interrupt process, write [C:\Users\zengjing\Downloads\Hlk52357013 - Hlk52357103](#) to clear the interrupt pending and execute the process of waiting for the interrupt.
- Step 3** Resume the interrupt and continue to execute the interrupted process.

3.9.4.3 Configuring DMAC

To configure the DMAC, follow the guidelines below:

- Make sure the transfer bit width of IO devices is consistent with the offset of the start address.
- The MBUS protocol does not support the read operation of non-integer words. For the devices whose bit width is not word-aligned, after receiving the read command, they should resolve the read command according to their FIFO bit width instead of the command bit width, and ignore the redundant data caused by the inconsistency of the bit width.
- When the DMA transfer is paused, this is equivalent to invalid DRQ. Because there is a certain time delay between DMA transfer commands, the DMAC will not stop data transfer until the DMAC finishes processing the current command and the commands in Arbiter (at most 32 bytes data).

DMAC application example:

```
writel(0x00000000, mem_address + 0x00); //Set configurations. The mem_address must be word-aligned.  
writel(0x00001000, mem_address + 0x04); // Set the start address for the source device.  
writel(0x20000000, mem_address + 0x08); //Set the start address for the destination device.  
writel(0x00000020, mem_address + 0x0C); // Set the data package size.  
writel(0x00000000, mem_address + 0x10); //Set the parameters.  
writel(0xFFFFF800, mem_address + 0x14); //Set the start address for the next descriptor.  
writel(mem_address, 0x01C02000+ 0x100 + 0x08); //Set the start address for the DMA channel0 descriptor.  
do{  
    If(mem_address == readl(0x01C02000 + 0x100 + 0x08));  
    break;  
}while(1); //Make sure that the writing operation is valid.  
writel(0x00000001, 0x01C02000 + 0x100 + 0x00); // Enable DMA channel0 transfer.
```

The DMAC supports increasing data package in transfer, pay attention to the following points:

- The 0xFFFFF800 value of [DMAC_FDESC_ADDR_REGN](#) indicates that the DMA channel has got back the descriptor of the last package. The DMA channel will automatically stop the data transfer after transferring the current package.
- To add a package during the data transfer, check if the DMA channel has got back the descriptor of the last package. If yes, you cannot add any package in the current queue. Request another DMA channel with

a new DRQ to transfer the package. Otherwise, you can add the package by modifying the [**DMAC_FDESC_ADDR_REGN**](#) of the last package from 0xFFFFF800 to the start address of the to-be-added package.

To ensure that the modification is valid, read the value of [**DMAC_FDESC_ADDR_REGN**](#) after the modification. The value 0xFFFFF800 indicates the modification fails and the other values indicate you have successfully added packages to the queue.

Another problem is, the system needs some time to process the modification, during which the DMA channel may get back the descriptor of the last package. You can read [**DMAC_CUR_SRC_REGN**](#) and [**DMAC_CUR_DEST_REGN**](#) and check if the increasing memory address accords with the information of the added package. If yes, the package is added successfully; otherwise, the modification failed.

To ensure a higher rate of success, it is suggested that you add the package before the half package interrupt of the penultimate package.

3.10 Thermal Sensor Controller (THS)

3.10.1 Overview

The thermal sensors are common elements in wide range of modern system on chips (SoCs) platform. The thermal sensors are used to constantly monitor the temperature on the chip.

The thermal sensor controller (THS) embeds one thermal sensor located in the CPU. When the temperature reaches a certain thermal threshold, the thermal sensor can generate interrupts to the software to lower the temperature via the dynamic voltage and frequency scaling (DVFS) technology.

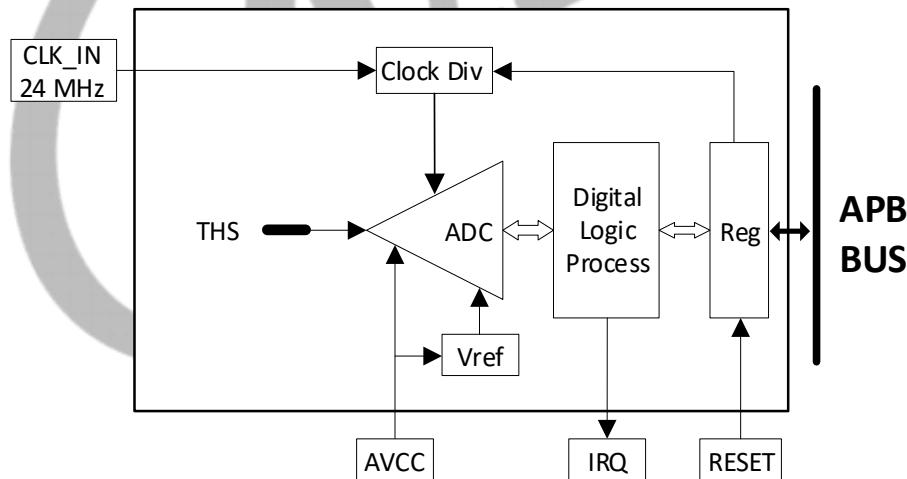

The THS has the following features:

- Temperature accuracy: $\pm 3^{\circ}\text{C}$ from 0°C to $+100^{\circ}\text{C}$, $\pm 5^{\circ}\text{C}$ from -25°C to $+125^{\circ}\text{C}$
- Averaging filter for thermal sensor reading
- Supports over-temperature protection interrupt and over-temperature alarm interrupt

3.10.2 Block Diagram

The following figure shows a block diagram of the THS.

Figure 3-25 THS Block Diagram

3.10.3 Functional Description

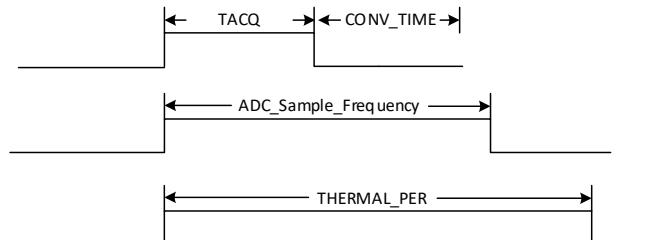

3.10.3.1 Clock Source

The THS gets one clock source: OSC24M. For details about clock configurations, refer to section 3.3 “[CCU](#)”.

3.10.3.2 Timing Requirements

The following figure shows the timing requirements for the THS.

Figure 3-26 Thermal Sensor Timing Requirement

CLK_IN = 24 MHz

CONV_TIME (Conversion Time) = $1/24\text{ MHz} \times 14\text{ Cycles} = 0.583\text{ us}$

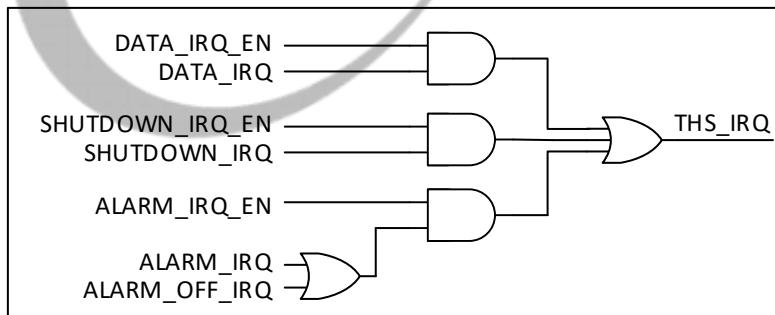

TACQ > $1/24\text{ MHz} \times 24\text{ Cycles}$

THERMAL_PER > ADC_Sample_Frequency > TACQ + CONV_TIME

3.10.3.3 Interrupts

The THS has four interrupt sources: DATA_IRQ, SHUTDOWN_IRQ, ALARM_IRQ, and ALARM_OFF_IRQ. The following figure shows thermal sensor interrupt sources.

Figure 3-27 Thermal Sensor Controller Interrupt Source

DATA_IRQ: The interrupt is generated when the measured sensor_data is updated.

SHUTDOWN_IRQ: The interrupt is generated when the temperature is higher than the shutdown threshold.

ALARM_IRQ: The interrupt is generated when the temperature is higher than the Alarm_Threshold.

ALARM_OFF_IRQ: The interrupt is generated when the temperature drops to lower than the Alarm_Off_Threshold. It is triggered at the fall edge.

3.10.3.4 THS Temperature Conversion Formula

$$T = (\text{sensor_data} - 2800) / (-14.85)$$

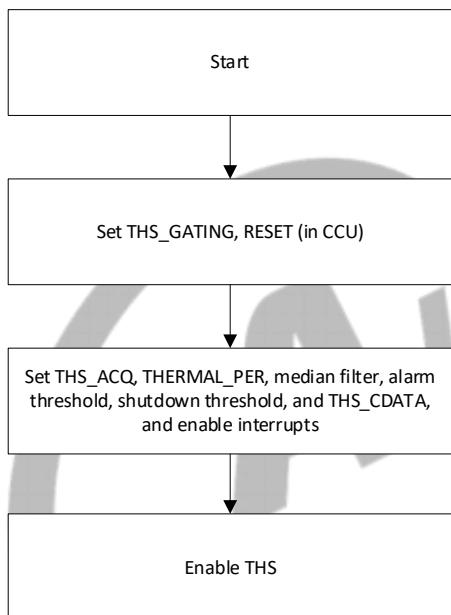

Unit of T: Celsius degree (°C).

The sensor_data is read from the sensor data register.

3.10.4 Programming Guidelines

The initial process of the THS is as follows.

Figure 3-28 THS Initial Process

In the final test (FT) stage, the THS is calibrated through the ambient temperature, and the calibration value is written in the SID module. The following table shows the THS information in the SID.

Table 3-15 THS Information in the SID

Base Address: 0x14	Register Name: THS
Bit	Description
27:16	The calibration value of the T-sensor.

Before enabling THS, read eFuse value and write the value to [THS_CDATA](#).

Query Mode

Step 1 Write 0x1 to the bit[16] of [THS_BGR_REG](#) to dessert the reset.

- Step 2** Write 0x1 to the bit[0] of [THS_BGR_REG](#) to open the THS clock.
- Step 3** Write 0x2F to the bit[15:0] of [THS_CTRL](#) to set the ADC acquire time.
- Step 4** Write 0x1DF to the bit[31:16] of [THS_CTRL](#) to set the ADC sample frequency divider.
- Step 5** Write 0x3A to the bit[31:12] of [THS_PER](#) to set the THS work period.
- Step 6** Write 0x1 to the bit[2] of [THS_FILTER](#) to enable the temperature convert filter.
- Step 7** Write 0x1 to the bit[1:0] of [THS_FILTER](#) to select the filter type.
- Step 8** Read THS eFuse value from SID, then write the eFuse value to [THS_CDATA](#) to calibrate THS.
- Step 9** Write 0x1 to the bit[0] of [THSO_EN](#) to enable THS.
- Step 10** Read the bit[0] of [THS_DATA_INTS](#). If it is 1, the temperature conversion is complete.
- Step 11** Read the bit[11:0] of [THS_DATA](#), and calculate the THS temperature based on section 3.10.3.4 “[THS Temperature Conversion Formula](#)”.
- ### Interrupt Mode
- Step 1** Write 0x1 to the bit16 of [THS_BGR_REG](#) to dessert the reset.
- Step 2** Write 0x1 to the bit0 of [THS_BGR_REG](#) to open the THS clock.
- Step 3** Write 0x2F to the bit[15:0] of [THS_CTRL](#) to set the ADC acquire time.
- Step 4** Write 0x1DF to the bit[31:16] of [THS_CTRL](#) to set the ADC sample frequency divider.
- Step 5** Write 0x3A to the bit[31:12] of [THS_PER](#) to set the THS work period.
- Step 6** Write 0x1 to the bit2 of [THS_FILTER](#) to enable the temperature convert filter.
- Step 7** Write 0x1 to the bit[1:0] of [THS_FILTER](#) to select the filter type.
- Step 8** Read THS eFuse value from SID, and then write the eFuse value to [THS_CDATA](#) to calibrate THS.
- Step 9** Write 0x1 to the bit[0] of [THS_DATA_INTC](#) to enable the interrupt of THS.
- Step 10** Set interrupt based on GIC module.
- Step 11** Put the interrupt handler address into the interrupt vector table.
- Step 12** Write 0x1 to the bit[0] of [THSO_EN](#) to enable THS.
- Step 13** Read the bit[0] of [THS_DATA_INTS](#). If it is 1, the temperature conversion is complete.
- Step 14** Read the bit[11:0] of [THS_DATA](#), and calculate the THS temperature based on section 3.10.3.4 “[THS Temperature Conversion Formula](#)”.

3.11 IOMMU

3.11.1 Overview

The I/O Memory management unit (IOMMU) is designed for the specific memory requirements of products. It maps the virtual address (sent by peripheral access memory) to the physical address. The IOMMU allows multiple ways to manage the location of physical address, and it can use physical address which has potentially conflict mapping for different processes to allocate memory space, and also allow application of non-continuous address mapping to continuous virtual address space.

Features:

- Supports virtual address to physical address mapping by hardware implementation
- Supports VE, CSI, DE, G2D, DI parallel address mapping
- Supports VE, CSI, DE, G2D, DI bypass function independently
- Supports VE, CSI, DE, G2D, DI pre-fetch independently
- Supports VE, CSI, DE, G2D, DI interrupt handing mechanism independently
- Supports 2 levels TLB (level1 TLB for special using, and level2 TLB for sharing)
- Supports TLB Fully cleared and Partially disabled
- Supports trigger PTW behavior when TLB miss
- Supports checking the permission

3.11.2 Block Diagram

The internal module of IOMMU mainly has the following parts.

Micro TLB: level1 TLB, 64 words. Each peripheral corresponds to a TLB, which caching the level2 page table for the peripheral.

Macro TLB: level2 TLB, 4K words. Each peripheral shares a level2 TLB for caching the level2 page table.

Prefetch Logic: Each Micro TLB corresponds to a Prefetch Logic. By monitoring each master device to predict the bus access, the secondary page table corresponding to the address to be accessed can be read from memory and stored in the secondary TLB to improve hit ratio.

PTW Logic: Page Table Walk, mainly contains PTW Cache and PTW. The PTW Cache is used to store the level1 page table; when the virtual address VA missed in the level1 and level2 TLB, it will trigger the PTW. PTW Cache can store 512 level1 page tables, that is, 512 words.

PMU: Performance Monitoring Unit, which is used to count hit efficiency and latency.

APB Interface: IOMMU register instantiation module. CPU reads and writes the IOMMU register by APB bus.

The following figure shows the internal block diagram of IOMMU.

Figure 3-29 IOMMU Block Diagram

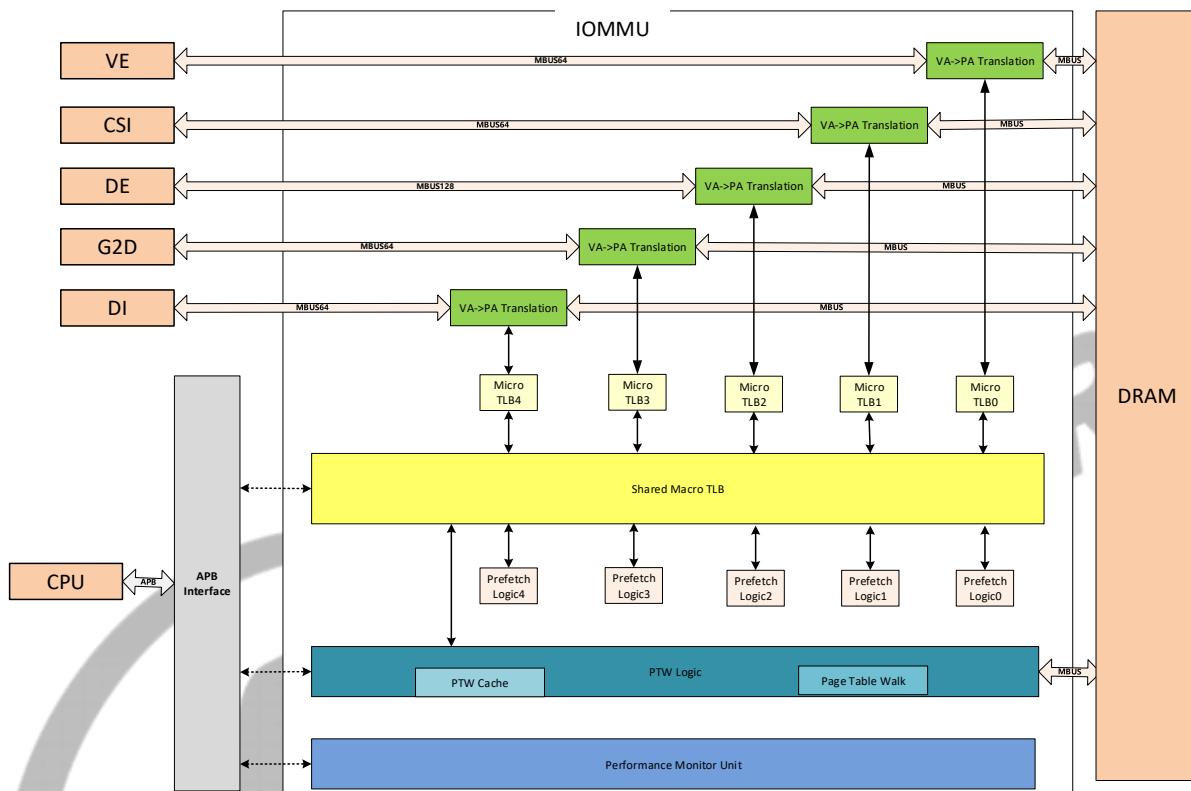

Table 3-16 Correspondence Relation between Master and Module

Master Number	Module
Master0	VE
Master1	CSI
Master2	DE
Master3	G2D
Master4	DI

3.11.3 Functional Description

3.11.3.1 Initialization

- Release the IOMMU reset signal by writing 1 to [IOMMU RESET REG\[31\]](#);

- Write the base address of the first TLB to [IOMMU_TTB_REG](#);
- Set [IOMMU_INT_ENABLE_REG](#);
- Enable the IOMMU by configuring [IOMMU_ENABLE_REG](#) in the final.

3.11.3.2 Address Changing

In the process of address mapping, The peripheral virtual address VA[31:12] are retrieved in the Level1 TLB, when TLB hits, the mapping finished, or they are retrieved in the Level2 TLB in the same way. If TLB hits, it will write the hit mapping to the Level1 TLB, and hits in Level1 TLB. If Level1 and Level2 TLB are retrieved fail, it will trigger the PTW. After opening peripheral bypass function by setting IOMMU Bypass Register, IOMMU will not map the address for peripheral typed the address, and it will output the virtual address as physical address. The typical scenarios are as follows.

Micro TLB hit

- Step 1** The master device sends a transfer command to send the address to the corresponding Micro TLB, and searches the Level2 page table corresponding to virtual address;
- Step 2** If Micro TLB hits, it will return a corresponding physical addresses and the Level2 page table of permission Index;
- Step 3** Address transform module converts the virtual address into physical address, and checks the permissions at the same time. If pass, the transfer is completed.

Micro TLB miss, Macro TLB hit

- Step 1** The master device sends a transfer command to send the address to the corresponding Micro TLB, and searches the Level2 page table corresponding to virtual address;
- Step 2** If Micro TLB misses, then continue to search Macro TLB;
- Step 3** If Macro TLB hits, it will return the Level2 page table to Micro TLB;
- Step 4** Micro TLB receives the page table and puts it to Micro TLB (if this Micro TLB is full, there will happen the replace activity), at the same time, the page table entry is sent to address translation module;
- Step 5** Address transform module converts the virtual address into physical address, and checks the permissions at the same time. If pass, the transfer is completed.

Micro TLB miss, Macro TLB miss, PTW Cache hit

- Step 1** The master device sends a transfer command to send the address to the corresponding Micro TLB, and searches the Level2 page table corresponding to virtual address;
- Step 2** If Micro TLB misses, then continue to search Macro TLB;
- Step 3** If Macro TLB misses, then it will send the request to the PTW to return the corresponding page table;
- Step 4** PTW first accesses PTW Cache, confirms that the required Level1 page table exists in the PTW Cache, sends the page table to PTW logic;
- Step 5** PTW logic returns the corresponding Level2 page table from memory page table according to Level1 page table, checks the effectiveness, and sends to Macro TLB;
- Step 6** Macro TLB stores the Level2 page table (there may happen the replace activity), and will return the Level2 page table to Micro TLB;
- Step 7** Micro TLB receives the page table entries and puts it to the Micro TLB (if this Micro TLB is full, there will happen the replace activity), and sends page table entries to address translation module;
- Step 8** Address transform module converts the virtual address into physical address, and checks the permissions at the same time. If pass, the transfer is completed.

Micro TLB miss, Macro TLB miss, PTW Cache miss

- Step 1** The master device sends a transfer command to send the address to the corresponding Micro TLB, and searches the Level2 page table corresponding to virtual address;
- Step 2** If Micro TLB misses, then continue to search Macro TLB;
- Step 3** If Macro TLB misses, there will send the request to the PTW to return the corresponding page table;
- Step 4** PTW accesses PTW Cache, the Level1 page table is unnecessary;
- Step 5** PTW accesses memory to get the corresponding Level1 page table and stores it to the PTW Cache (there may happen the replace activity);
- Step 6** PTW logic returns the corresponding Level2 page table from memory page table according to Level1 page table, checks the effectiveness, and sends to Macro TLB;
- Step 7** Macro TLB stores the Level2 page table (there may happen the replace activity), and returns the Level 2 page table to Micro TLB;
- Step 8** Micro TLB receives the page table entries and puts it to the Micro TLB (if this Micro TLB is full, there will happen the replace activity), and sends page table entries to address translation module;
- Step 9** Address transform module converts the virtual address into physical address, and checks the permissions at the same time. If pass, the transfer is completed.

Permission error

- Step 1** Permission checking always performs in the address conversion;
- Step 2** Once the permission checking makes mistake, the new access of the master suspends, but continues before this access;
- Step 3** Set the error status register;
- Step 4** Trigger interrupt.

Invalid Level1 page table

- Step 1** Invalid Level1 page table is checked when PTW logic reads the new level page table from memory;
- Step 2** The PTW reads sequentially two page table entries from the memory (64-bit data, a complete cache line), and stores in the PTW cache;
- Step 3** If the current page table is detected invalid, then the error flag is set, and the interrupt is triggered, the cache line need to be invalidated.

NOTE

- Invalid page table has two situations: the reading target page table from the memory is invalid; and the page table stored in PTW Cache with target page table is found to be invalid after using;
- If a page table is invalid, then the total cache line (that is two page tables) need to be invalidated.

Invalid Level2 page table

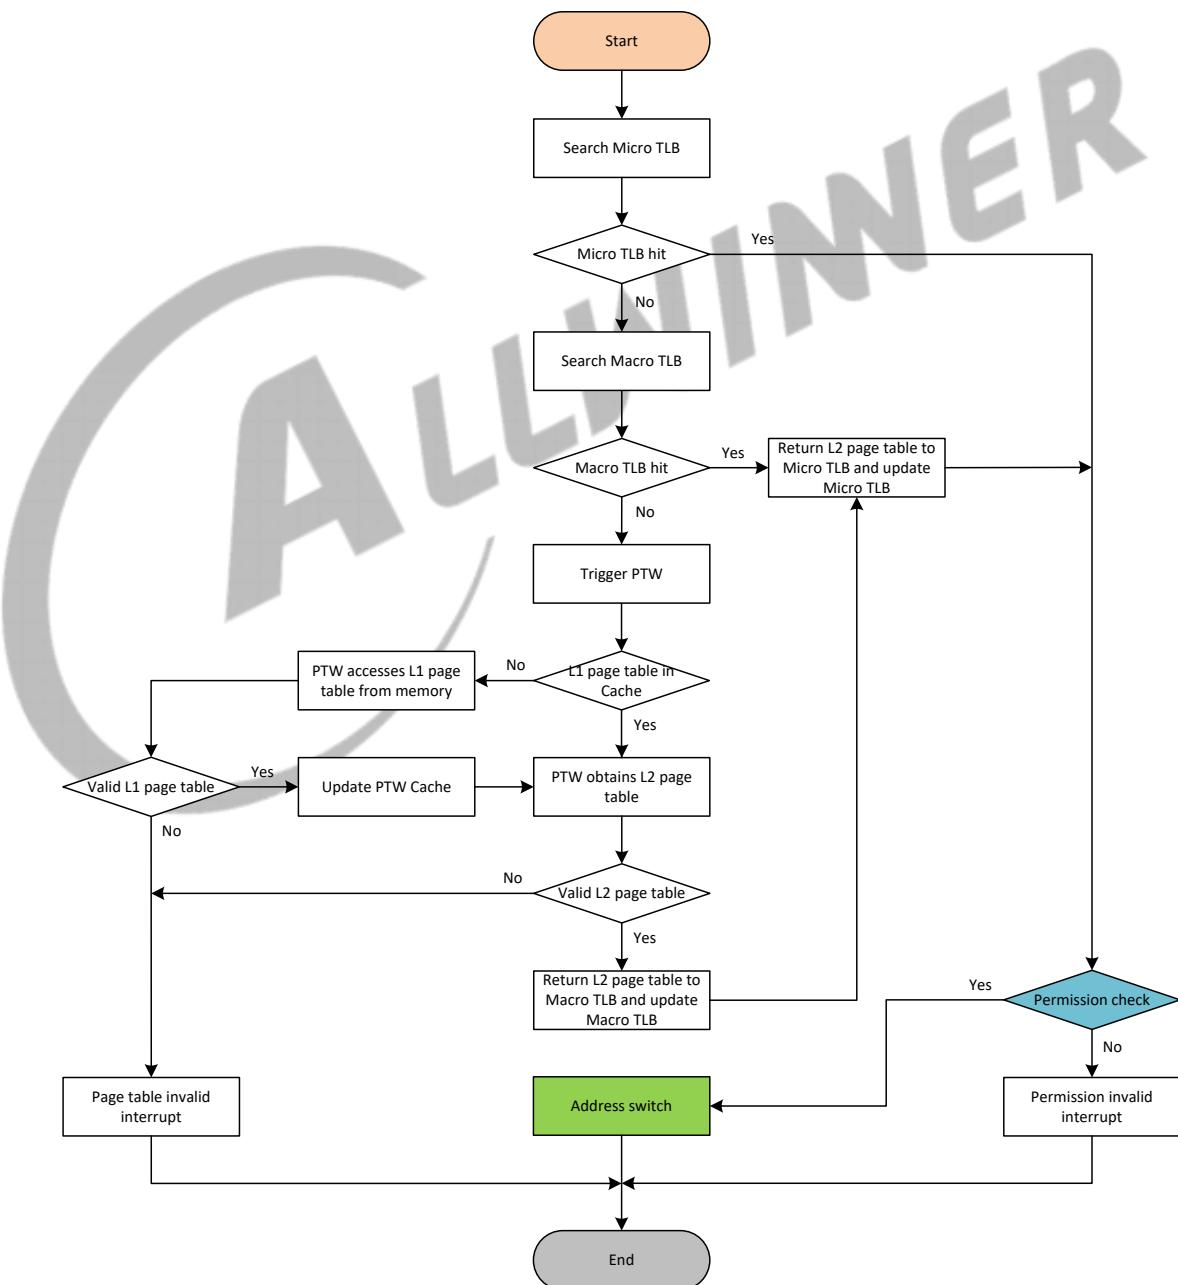

- Step 1** Invalid Level2 page table checks when Macro TLB reads the new level page table from memory;
- Step 2** The Macro TLB reads sequentially two page table entries from the memory (64-bit data, a complete cache line), and stores in the Macro TLB;
- Step 3** If the current page table is detected invalid, then the error flag is set, and the interrupt is triggered, the cache line need to be invalidated.

**NOTE**

- Invalid page table has two situations: the reading target page table from the memory is invalid; and the page table stored in Macro TLB with target page table is found to be invalid after using.
- If a page table is invalid, then the total cache line (that is two page tables) need to be invalidated.

The following figure shows the internal address switch process.

Figure 3-30 Internal Switch Process

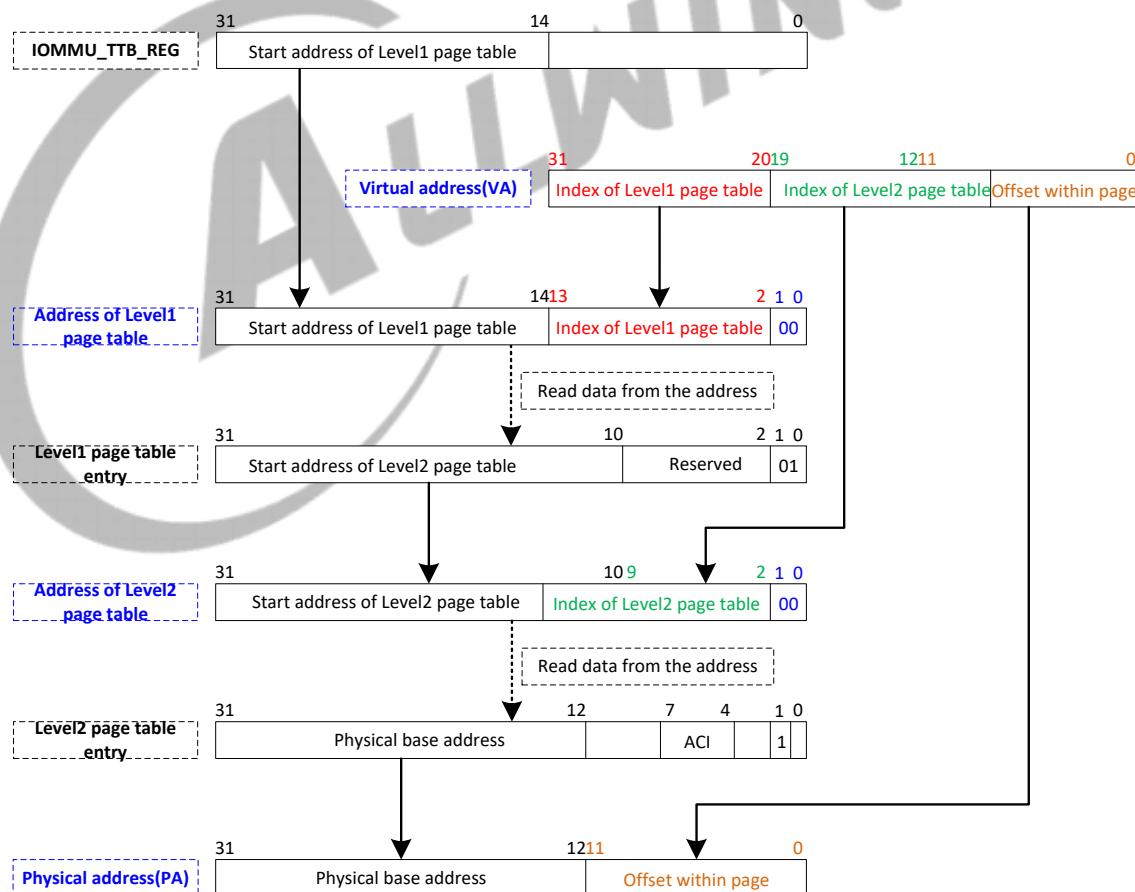

3.11.3.3 VA-PA Mapping

IOMMU page table is defined as Level2 mapping, the first level is 1M address space mapping, the second level is 4K address space. This version does not support 1K, 16K and other page table size. IOMMU supports a page table only, its meaning is:

- All peripherals connected to IOMMU use the same virtual address space;
- The virtual address space of the peripherals can overlap;
- Different virtual addresses can map to the same physical address space;

Base address of the page table is defined by software, and it needs 16 KB address alignment; Page table of the Level2 table item needs 1 KB address alignment. The following figure shows a complete VA-PA address translation process.

Figure 3-31 VA-PA Switch Process

3.11.3.4 Clear and Invalidate TLB

When the content of multi page tables refreshes or the address of page table changes, all VA-PA mapping which has been cached in TLB will no longer be valid, then you need configure **IOMMU TLB Flush Enable Register** to clear the TLB or PTW Cache. First suspend the access to TLB or Cache, then configure the corresponding Flush bit of **IOMMU TLB Flush Enable Register**, after the operation takes effect, the related peripherals can continue to send new access memory operations.

When some page table is invalid or incorrect mapping, you can set the TLB Invalidiation relevant register to invalidate some TLB VA-PA mapping pairs. There are two modes to invalidate the TLB operation.

(1) Mode0 (Old mode)

Step 1 Set **IOMMU TLB Invalidation Mode Select Register** to 0 to select mode0;

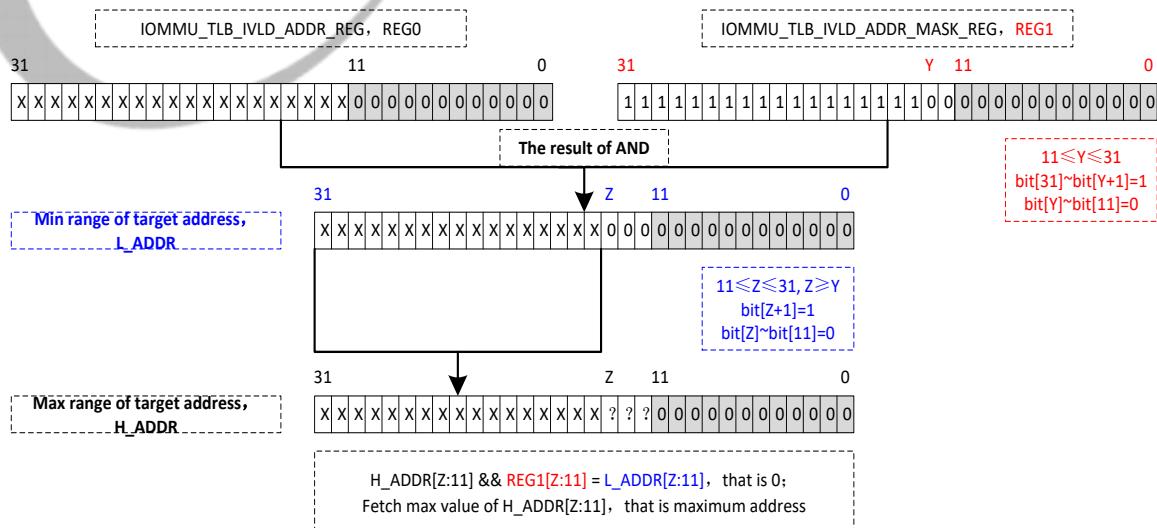

Step 2 Write target address to **IOMMU TLB Invalidation Address Register**;

Step 3 Set configuration values to **IOMMU TLB Invalidation Address Mask Register**, the requirements are as follows:

- The value of **IOMMU TLB Invalidation Address Mask Register** cannot be less than the **IOMMU TLB Invalidation Address Register**.
- The higher bit of **IOMMU TLB Invalidation Address Mask Register** must be continuous 1, the lower bit must be continuous 0. For example, 0xfffff000, 0xffffe000, 0xffffc000, 0xffff8000, 0xffff0000 belongs to the legal value; and 0xffffd000, 0xffffb000, 0xffffa000, 0xffff9000, 0xffff7000 belongs to the illegal values.

Step 4 Configure **IOMMU TLB Invalidation Enable Register** to enable the invalid operation. Among the way to determine the invalid address is to get maximum valid bit and determine target address range by target address AND mask address. The following figure shows the process.

Figure 3-32 Invalid TLB Address Range

For example:

- a) When the value of **IOMMU TLB Invalid Address Mask Register** is 0xFFFFF000 by default, the result of AND is target address, that is, only target address is invalid.
- b) When the value of **IOMMU TLB Invalid Address Mask Register** is 0xFFFFF0000, the value of **IOMMU TLB Invalid Address Register** is 0xEEEE1000, then the range of target address is from 0xEEEE0000 to 0xEEEEF000.
- c) When the value of **IOMMU TLB Invalid Address Mask Register** is 0xFFFFC000, the value of **IOMMU TLB Invalid Address Register** is 0xEEEE8000, then the range of target address is from 0xEEEE8000 to 0xEEEB000.
- d) When the value of **IOMMU TLB Invalid Address Mask Register** is 0xFFFF8000, the value of **IOMMU TLB Invalid Address Register** is 0xEEEC000, then the range of target address is from 0xEEEE8000 to 0xEEEF000.
- e) When the value of **IOMMU TLB Invalid Address Mask Register** is 0xFFFFC000, the value of **IOMMU TLB Invalid Address Register** is 0xEEE0000, then the range of target address is from 0xEEEE0000 to 0xEEE3000.

(2) Mode1 (New mode)

- Step 1** Set **IOMMU TLB Invalid Mode Select Register** to 1 to select mode1;
- Step 2** Set the starting address of invalid TLB by **IOMMU TLB Invalid Start Address Register**, and set the ending address of invalid TLB by **IOMMU TLB Invalid End Address Register**;
- Step 3** Configure **IOMMU TLB Invalid Enable Register** to enable invalid operation, then the related TLB operation is invalidated.

3.11.3.5 Clear and Invalidate PTW Cache

There are two modes to invalidate the PTW cache operation.

(1) Mode0 (Old mode)

- Step 1** Set **IOMMU PC Invalid Mode Select Register** to 0 to select mode0;
- Step 2** Set the address register that needs to be invalidated to **IOMMU PC Invalid Address Register** (the addresses need to be aligned with 1 MB);
- Step 3** Configure **IOMMU PC Invalid Enable Register** to enable the invalid operation. That is, the PTW cache operation of a cacheline is invalidated.

(2) Mode1 (New mode)

- Step 1** Set **IOMMU PC Invalidation Mode Select Register** to 1 to select mode1;
- Step 2** Set the starting address of invalid TLB by **IOMMU PTW Invalidatio Start Address Register**, and set the ending address of invalid TLB by **IOMMU PC Invalidatio Start Address Register**;
- Step 3** Configure **IOMMU PC Invalidatio Enable Register** to enable invalid operation, then to invalid the related PWM cache operation is completed.

3.11.3.6 Page Table Format

Level1 Page Table

The format of Level1 page table is as follows.

Figure 3-33 Level1 Page Table Format

31	10 9	2 1 0
Start address of Level2 page table	Reserved	01

Bit[31:10]: Base address of Level2 page table;

Bit[9:2]: Reserved;

Bit[1:0]: 01 is valid page table; others are fault;

Level2 Page Table

The format of Level2 page table is as follows.

Physical base address		ACI	1	

Bit[31:12]: Physical address of 4K address;

Bit[11:8]: Reserved;

Bit[7:4]: ACI, permission control index; correspond to permission control bit of **IOMMU Domain Authority Control Register**;

Bit[3:2]: Reserved;

Bit[1]: 1 is valid page table; 0 is fault;

Bit[0]: Reserved

Permission Index

The read/write access control of series register such as **IOMMU Domain Authority Control Register** is as follows.

Bit[11:10]/Bit[27:26]: Master5 read/write permission control;

Bit[13:12]/Bit[29:28]: Master6 read/write permission control.

The value of **IOMMU Domain Authority Control Register** is read-only by default. Other registers can configure through system requirement. In address switch process, the corresponding relation between ACI and Domain is as follows.

Table 3-17 Relation between ACI and Domain

ACI	Domain	Register
0	Domain 0	IOMMU Domain Authority Control Register 0
1	Domain 1	IOMMU Domain Authority Control Register 0
2	Domain 2	IOMMU Domain Authority Control Register 1
3	Domain 3	IOMMU Domain Authority Control Register 1

13	Domain 13	IOMMU Domain Authority Control Register 6
14	Domain 14	IOMMU Domain Authority Control Register 7
15	Domain 15	IOMMU Domain Authority Control Register 7

After enabled **IOMMU Domain Authority Overwrite Register**, the read/write control permission can override all **IOMMU Domain Authority Control Register**.

3.11.4 Programming Guidelines

3.11.4.1 Resetting IOMMU

Before the IOMMU module software reset operation, make sure IOMMU is never opened, or all bus operations are completed, or DRAM and peripherals already open the corresponding switch, to shield the influence of IOMMU reset.

3.11.4.2 Enabling IOMMU

Before opening the IOMMU address mapping function, the **Translation Table Base Register** should be correctly configured, or all the masters are in the bypass state, or all the masters do not send the bus command.

3.11.4.3 Configuring TTB

Operating the register must close the address mapping function of IOMMU, that is, the IOMMU_ENABLE_REG[0] is 0; or the bypass function of all masters is set to 1; or the state of the TX bus command is none.

3.11.4.4 Clearing TTB

In the Flush operation, all TLB/Cache access will be suspended; but the operation entered the TLB will continue to complete before the Flush starts.

3.11.4.5 Reading/Writing VA Data

For target virtual address, read and write the corresponding physical address data to make sure whether IOMMU module address mapping function is normal. First, make sure to read or write, and then configure the target virtual address or write data, then start to read or write function, check whether the results are as expected after the operation is finished.

3.11.4.6 Using PMU Statistics Function

When PMU function is used for the first time, set **IOMMU PMU Enable Register** to enable statistics function; when reading the relevant Register, clear the enable bit of **IOMMU PMU Enable Register**; when PMU function is used next time, first **IOMMU PMU Clear Register** is set, after counter is cleared, set the enable bit of **IOMMU PMU Enable Register**.

Given a Level2 page table administers continuous 4 KB address, if Micro TLB misses in continuous virtual address, there may need to return a Level2 page table to hit from Macro TLB; but the hit number is not recorded in the Macro TLB hit and Micro TLB hit related register. So the true hit rate calculation is as follows:

$$\text{Hit Rate} = N1/M1 + (1-N1/M1)*N2/M2$$

N1: Micro TLB hit number

M1: Micro TLB access number

N2: Macro TLB hit number

M2: Macro TLB access number

3.11.6.23 0x00B0 IOMMU Domain Authority Control 0 Register (Default Value: 0x0000_0000)

Software can set 15 different permission control types in IOMMU_DM_AUT_CTRL_REG0–7. A default access control type is DOMAIN0. The read/write operation of DOMAIN1–15 is unlimited by default.

Software needs to set the index of the permission control domain corresponding to the page table item in the bit[7:4] of the Level2 page table, the default value is 0 (use domain0), that is, the read/write operation is not controlled.

Setting REG_ARD_OVWT can mask the Domain control defined by IOMMU_DM_AUT_CTRL_REG0–7. All Level2 page table type are covered by the type of REG_ARD_OVWT. The read/write operation is permitted by default.

3.11.6.32 0x0100 IOMMU Interrupt Enable Register (Default Value: 0x0000_0000)

Invalid page table and permission error can not make one device or multi-devices in system work normally.

Permission error usually happens in MicroTLB. The error generates interrupt and waits for processing through software.

Invalid page table usually happens in MacroTLB. The error can not influence the access of other devices. So the error page table needs go back the way it comes, but the error should not be written in each level TLB.

7:1	/	/	/
0	R/WAC	0x0	VA_CONFIG_START 0: No operation or operation is completed 1: Start After the operation is completed, the bit can clear automatically.

Read operation process:

- Write IOMMU_VA_REG[31:0];
- Write IOMMU_VA_CONFIG_REG[8] to 0;
- Write IOMMU_VA_CONFIG_REG[0] to 1 to start read-process;
- Query IOMMU_VA_CONFIG_REG[0] until it is 0;
- Read IOMMU_VA_DATA_REG[31:0];

Write operation process:

- Write IOMMU_VA_REG[31:0];
- Write IOMMU_VA_DATA_REG[31:0];
- Write IOMMU_VA_CONFIG_REG[8] to 1;
- Write IOMMU_VA_CONFIG_REG[0] to 1 to start write-process;
- Query IOMMU_VA_CONFIG_REG[0] until it is 0;

3.12 Message Box

3.12.1 Overview

The Message Box (MSGBOX) provides interrupt communication mechanism for on-chip processor.

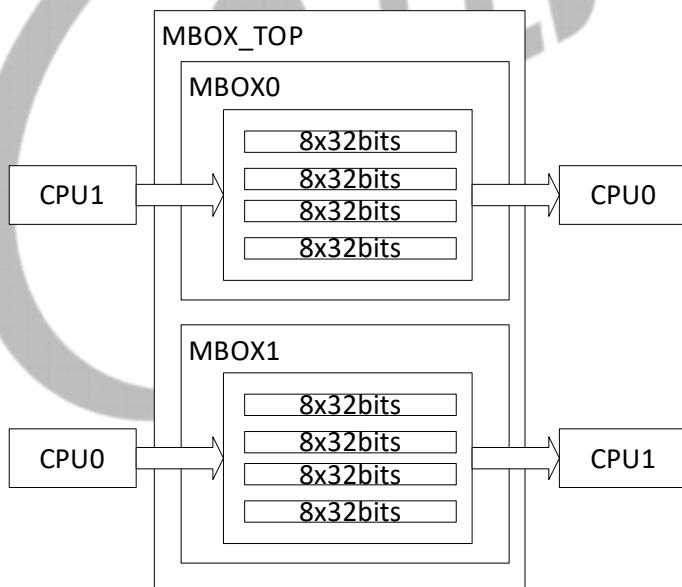

The MSGBOX has the following features:

- Supports 2 CPU to transmit information through channels. Each CPU has a MSGBOX.
 - CPU 0: ARM CPUX
 - CPU 1: DSP
- The channel between two CPU has 4 channels, and the FIFO depth of a channel is 8 x 32 bits
- Supports interrupts

3.12.2 Block Diagram

The following figure shows the block diagram of the message box.

Figure 3-36 Message Box Block Diagram

For MSGBOX0, CPU1: write; CPU0: read
For MSGBOX1, CPU0: write; CPU1: read

Each CPU has 4 channels. The two channels can be configured to be secure by software, the other two channels can be configured to be non-secure by software. The two secure channels or two non-secure channels can be configured as one synchronous box (Sending a message requires a response) or one asynchronous box (Sending a message does not require a response).

3.12.3 Functional Description

3.12.3.1 Clock and Reset

The MSGBOX is mounted on AHBO. Before accessing the MSGBOX registers, you need to de-assert the MSGBOX reset signal on AHBO bus and then open the MSGBOX gating signal on AHBO bus.

3.12.3.2 Typical Application

Several masters can build communication by configuring the MSGBOX. The communication parties have 4 channels. In a channel, the user1 is fixed as the transmitter and the user0 is fixed as the receiver. During the communication process, the current status can be judged through the interrupt or FIFO status.

3.12.3.3 Transmitter/Receiver Mode

At the same channel, user1 is fixed as transmitter, user0 is fixed as receiver.

3.12.3.4 Interrupt

Each channel can configure independently the interrupt enable bit, a read interrupt will be generated when the channel is empty, a write interrupt will be generated when the channel is non-full. For each CPU, all channels generate a read interrupt together, that is, if only a channel is non-full, the read interrupt will be generated, this channel can be obtained by querying the interrupt status register.

3.12.3.5 FIFO Status

When channel FIFO is non-full, the FIFO_FULL_FLAG is 0, at the moment the FIFO can be written.

When channel FIFO is full, the FIFO_FULL_FLAG is 1, at the moment if FIFO is written again, the first data of FIFO can be covered.

See [MSGBOX_MSG_STATUS_REG](#) for FIFO status.

3.12.4 Programming Guidelines

3.12.4.1 Checking the Transfer Status via the Interrupt

Follow the steps below to check the transfer status:

Step 1 Enable the interrupt for the channel: Configure the interrupt enable bits of transmitter/receiver through [MSGBOX WR IRQ_EN REG/MSGBOX RD IRQ_EN REG](#). (user1: RX interrupt enable; user2: TX interrupt enable)

Step 2 Check the IRQ status of the corresponding queue through [MSGBOX WR IRQ_STATUS REG/MSGBOX RD IRQ_STATUS REG](#).

- If the FIFO is not full, the channel generates a transmission interrupt to remind the transmitter to transmit data. Write data to the FIFO in the interrupt handler, then clear the pending bit of the transmitter in [MSGBOX WR IRQ_STATUS REG](#) and the enable bit of the transmitter in [MSGBOX WR IRQ_EN REG](#).
- If the FIFO has new data, the channel generates a reception interrupt to remind the receiver to receive data. Read data from the FIFO in interrupt handler, then clear the pending bit of the receiver in [MSGBOX RD IRQ_STATUS REG](#) and the enable bit of the receiver in [MSGBOX RD IRQ_EN REG](#).

3.12.4.2 Checking the Transfer Status via the FIFO

Follow the steps below to check the FIFO status of the corresponding queue:

- If the FIFO is not full, the transmitter fills the FIFO to 8*32 bits.
- If the FIFO is full, the receiver reads the FIFO data, and reads [MSGBOX FIFO STATUS REG](#) to acquire the current FIFO data amount and the FIFO data amount before reading, which means no data is dropped.

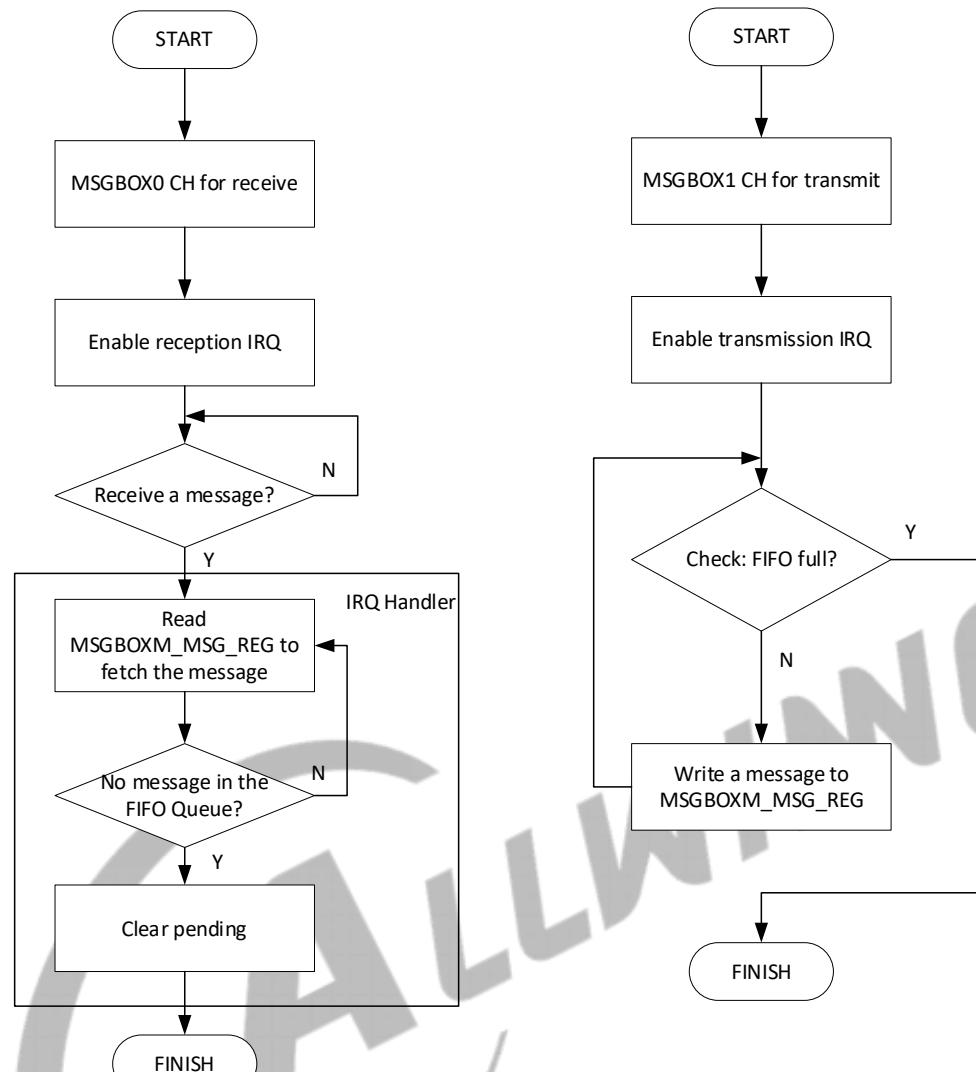

3.12.4.3 Transmitting/Receiving Message

The following figure shows the communication process between MSGBOX0 and MSGBOX1.

MSGBOX0: receiving message

MSGBOX1: transmitting message

3.13 Spinlock

3.13.1 Overview

The spinlock provides hardware synchronization mechanism in multi-core systems. With the lock operation, the spinlock prevents multiple processors from handling the sharing data simultaneously and thus ensure the coherence of data.

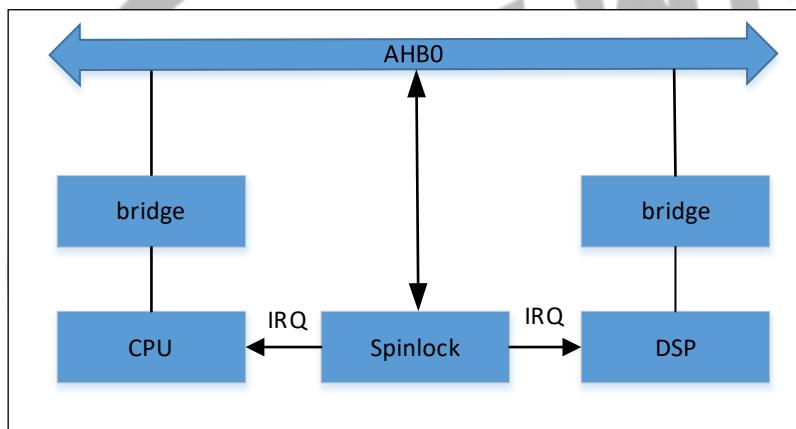

The spinlock has the following features:

- Supports 32 lock units
- Two kinds of lock status: locked and unlocked
- Lock time of the processor is predictable (less than 200 cycles)

3.13.2 Block Diagram

The following figure shows the block diagram of the spinlock.

Figure 3-38 Spinlock Block Diagram

3.13.3 Functional Description

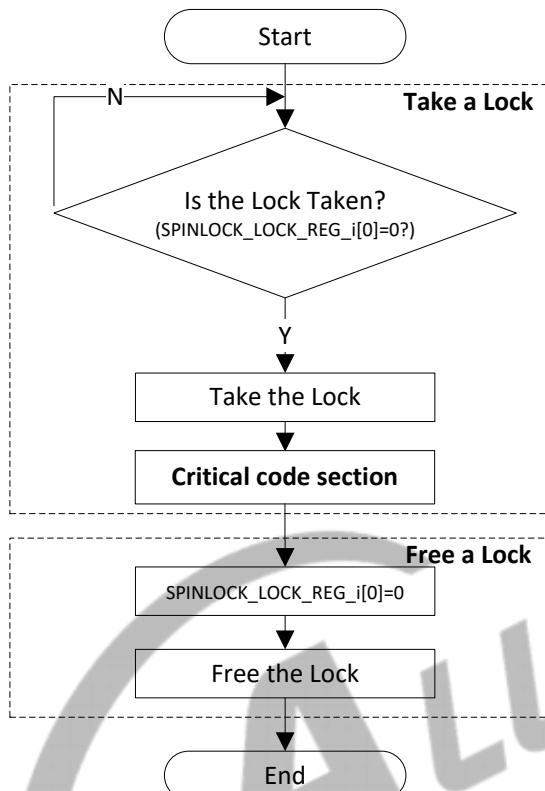

3.13.3.1 Clock and Reset

The spinlock is mounted on AHBO. Before accessing the spinlock registers, you need to de-assert the reset signal on AHBO bus and then open the corresponding gating signal on AHBO bus.

3.13.3.2 Typical Application

The following figure shows a typical application of the spinlock. A processor locks spinlock0 before executing specific codes, and then unlocks the codes. After the lock is freed, other processors can read or write the data.

Figure 3-39 Spinlock Typical Application Diagram

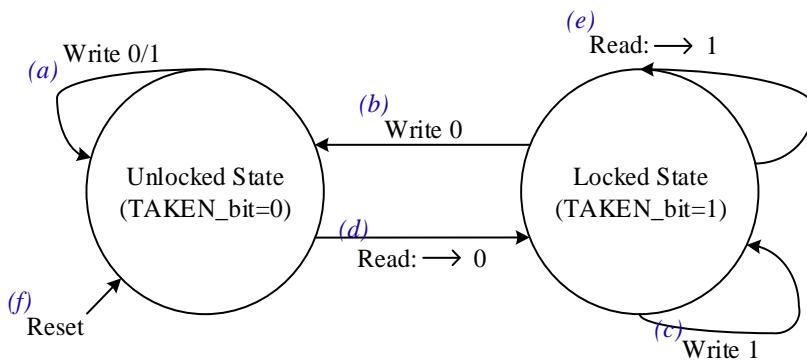

3.13.3.3 Spinlock State Machine

When a processor uses spinlock, it needs to acquire the spinlock status through [SPINLOCK_STATUS_REG](#).

Reading operation: when the return value is 0, it indicates that the spinlock enters the locked status; reading this status bit again can return 1, it indicates that the spinlock is the locked status.

Writing operation: when the spinlock is in the locked status, writing 0 can convert the spinlock to the unlocked status, the writing operation for other status is invalid.

The following figure shows the spinlock state machine.

Figure 3-40 Spinlock State Machine

- a) When the spinlock is in the unlocked state, writing 0/1 has no effect;
- b) When the spinlock is in the locked state, writing 0 can convert the corresponding spinlock to the unlocked state;
- c) When the spinlock is in the locked state, writing 1 has no effect;
- d) When the spinlock is in the unlocked state, reading the bit can return 0 (it indicates spinlock enters into the locked state);
- e) When the spinlock is in the locked state, reading the bit can return 1 (it indicates spinlock is in the locked state);
- f) After reset, the spinlock is in the unlock state by default.

3.13.4 Programming Guidelines

3.13.4.1 Switching the Status

Follow the steps below to switch the lock status of a spinlock.

- Step 1** When the read value from [SPINLOCKN_LOCK_REG \(N=0~31\)](#) is 0, the spinlock comes into the locked status.
- Step 2** Execute the application codes, and the status of [SPINLOCK_STATUS_REG](#) is 1.
- Step 3** Write 0 to [SPINLOCKN_LOCK_REG \(N=0~31\)](#), the spinlock converts into the unlocked status, and the corresponding spinlock is released.

3.13.4.2 Processing the Interrupt

The spinlock generates an interrupt when a lock is freed (the lock status converts from the locked status to the unlocked status).

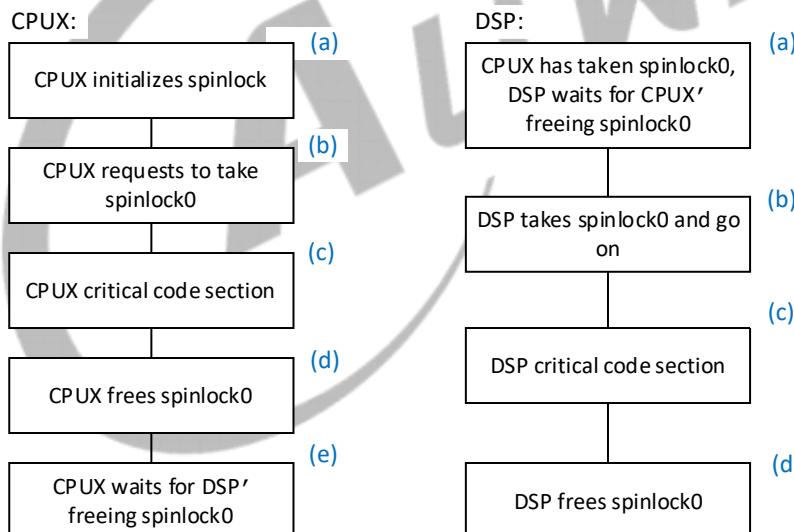

Follow the steps below to process the interrupt:

- Step 1** Configure the interrupt enable bit of the corresponding spinlock in [SPINLOCK_IRQ_EN_REG](#) to enable the interrupt.
- Step 2** The spinlock generates an interrupt when its status converts from the locked status to the unlocked status, and the corresponding bit of the [SPINLOCK_IRQ_STA_REG](#) turns to 1.
- Step 3** Execute the interrupt handle function and clear the pending bit.

3.13.4.3 Taking/Freeing Spinlock

Take the synchronization between CPUX and DSP with Spinlock0 as an example, the CPUX and DSP perform the following steps.

Figure 3-41 CPUX and DSP Taking/Freeing Spinlock0 Process

CPUX:

- (a) The CPUX initializes Spinlock.
- (b) Check lock register0 (SPINLOCK_STATUS_REG0) status. If it is taken, check until CPUX frees spinlock0 and then request to take spinlock0. Otherwise, retry until the lock register0 is taken.
- (c) Execute CPUX critical code.

(d) After executing CPUX critical code, the CPUX frees spinlock0.

(e) The CPUX waits for DSP to free spinlock0.

DSP:

(a) If the CPUX has taken spinlock0, the DSP waits for CPUX to free spinlock0.

(b) The DSP requests to take spinlock0. If it fails, retry until the lock register0 is taken.

(c) Execute DSP critical code.

(d) After executing DSP critical code, the DSP frees spinlock0.

The following codes are for reference.

-----CPUX-----

Step 1 CPUX initializes Spinlock

```
put_wvalue(SPINLOCK_BGR_REG,0x00010000);  
put_wvalue(SPINLOCK_BGR_REG,0x00010001);
```

Step 2 CPUX requests to take spinlock0

```
rdata=readl(SPINLOCK_STATUS_REG0); //Check lock register0 status

3.14 RTC

3.14.1 Overview

The Real Time Clock (RTC) is used to implement time counter and timing wakeup functions. The RTC can display the year, month, day, week, hour, minute, second in real time. The RTC has the independent power to continue to work in system power-off.

The RTC has the following features:

- Provides a 16-bit counter for counting day, 5-bit counter for counting hour, 6-bit counter for counting minute, 6-bit counter for counting second
- External connect a 32.768 kHz low-frequency oscillator for count clock
- Timer frequency is 1 kHz
- Configurable initial value by software anytime
- Supports timing alarm, and generates interrupt and wakeup the external devices
- Eight 32-bit user registers for storing power-off information

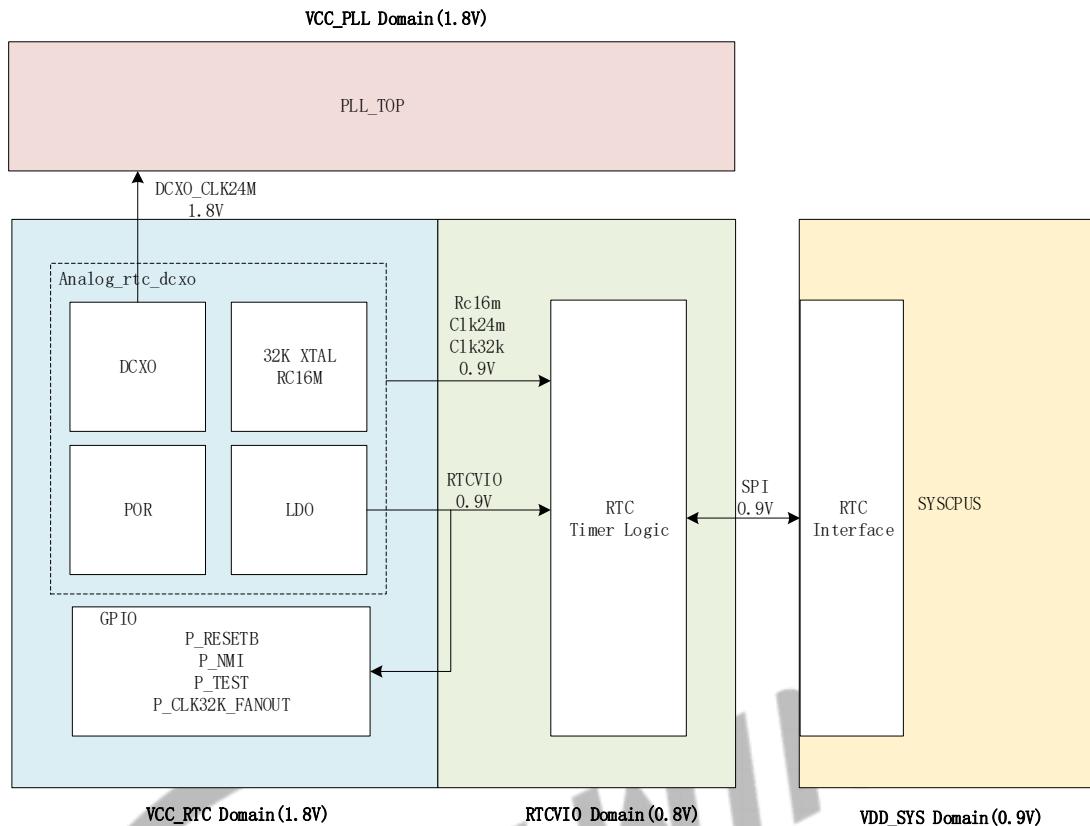

CAUTION

The register configuration of RTC is AHB bus, it only can support word operation, not byte operation and half-word operation.

3.14.2 Block Diagram

The following figure shows the block diagram of the RTC.

Figure 3-42 RTC Block Diagram

3.14.3 Functional Description

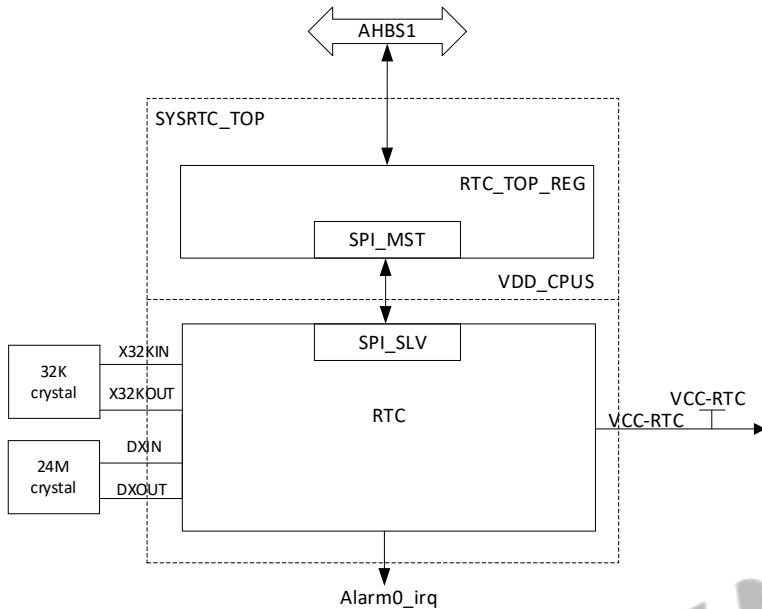

3.14.3.1 External Signals

Table 3-18 RTC External Signals

Signal	Description
X32KIN	32.768 kHz oscillator input
X32KOUT	32.768 kHz oscillator output
VCC-RTC	RTC high voltage, generated via external power

3.14.3.2 Typical Application

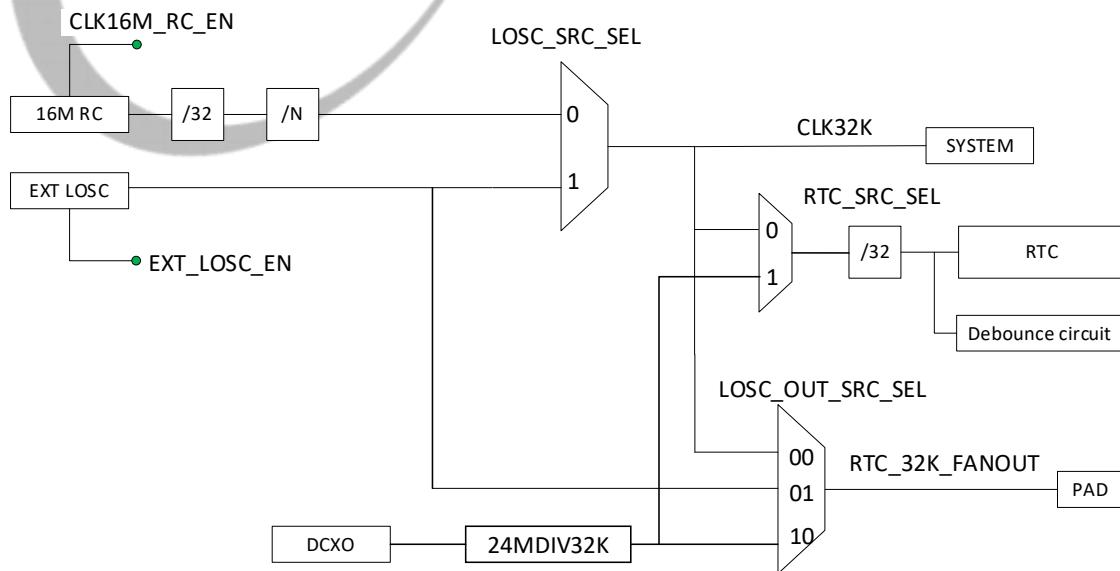

Figure 3-43 RTC Application Diagram

3.14.3.3 Clock Tree

The following figure shows the clock tree of the RTC.

Figure 3-44 RTC Clock Tree

- **LOSC**

The LOSC has 2 clock sources: internal RC, external low frequency crystal. The LOSC selects the internal RC by default, when the system starts, the LOSC can select by software the external low frequency crystal to provide much accuracy clock. The clock accurate of the LOSC is related to the accurate of the external low frequency crystal. Usually select 32.768 kHz crystal with ± 20 ppm frequency tolerance. When using internal RC, the clock can be changed by changing division ratio. When using external clock, the clock cannot be changed.

- **RTC**

The clock sources of RTC can be selected by related switches, including 32K divided by internal 16 MHz RC, 32K divided by external DCXO, and external 32.768 kHz crystal.

- **System 32K**

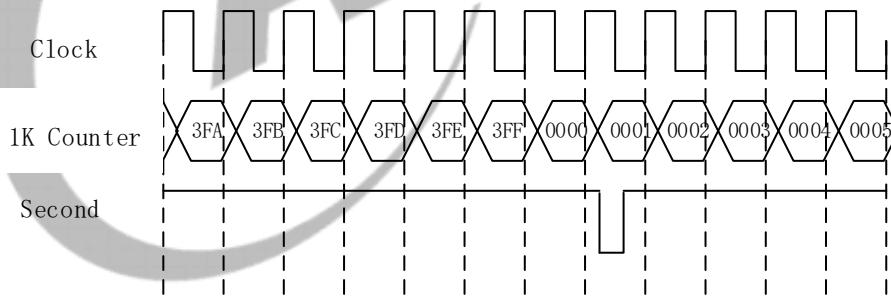

The clock sources of system 32K are from external 32.768 kHz crystal and 32K divided by the internal 16 MHz RC.

- **RTC_32K_FANOUT**

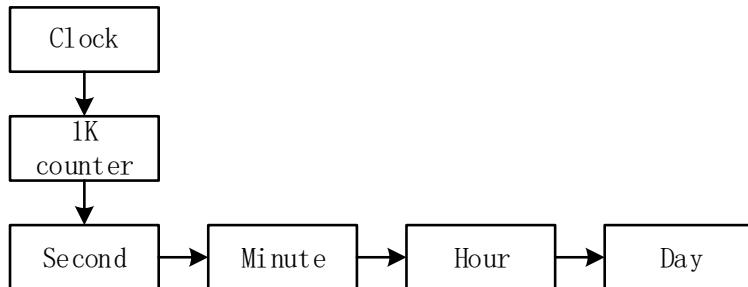

The clock source of RTC_32K_FANOUT can select CLK32K, external 32.768 kHz crystal or 32K divided by external DCXO.

3.14.3.4 Real Time Clock

Figure 3-45 RTC Counter

The 1K counter adds 1 on each rising edge of the clock. When the clock number reaches 0x3FF, 1K counter starts to count again from 0, and the second counter adds 1. The step structure of 1 kHz counter is as follows.

Figure 3-46 RTC 1 kHz Counter Step Structure

According to above implementation, the changing range of each counter is as follows.

Table 3-19 RTC Counter Changing Range

Counter	Range
Second	0 to 59
Minute	0 to 59
Hour	0 to 23
Day	0 to 65535 (The year, month, day need be transformed by software according to day counter)

CAUTION

Because there is no error correction mechanism in the hardware, note that each counter configuration should not exceed a reasonable counting range.

3.14.3.5 Alarm 0

The principle of alarm0 is a comparator. When RTC timer reaches the scheduled time, the RTC generates the interrupt, or outputs low level signal by NMI pin to wakeup power management chip.

The RTC only generates one interrupt when RTC timer reached the scheduled day, hour, minute and second counter, then the RTC needs to be set a new scheduled time, the next interrupt can be generated.

3.14.3.6 Power-off Information Storage

The RTC provides eight 32-bit general purpose register to store power-off information.

Because VCC-RTC always holds non-power-off state after VCC-RTC cold starts, when the system is in shutdown or standby scene, the CPU can judge software process by the storing information.

3.14.3.7 RTC_VIO

The RTC module has a LDO, the input source of the LDO is VCC_RTC, the output of the LDO is RTC_VIO, the value of RTC_VIO is adjustable, the RTC_VIO is mainly used for internal digital logic.

3.14.3.8 RC Calibration Usage Scenario

- Power-on: Select non-accurate 32K divided by internal RC.
- Normal scenario: Select external accurate 32K, or external calibrated 32K.
- Standby or power-off scenario: Select external accurate 32K, or external calibrated 32K.

3.14.4 Programming Guidelines

3.14.4.1 RTC Clock Control

- Step 1** Select clock source: Select clock source by the bit0 of [LOSC_CTRL_REG](#), the clock source is the internal RC oscillator by default. When the system starts, the clock source can be switched to the external 32K oscillator by software.
- Step 2** Auto switch: After enabled the bit[15:14] of [LOSC_CTRL_REG](#), the RTC automatically switches clock source to the internal oscillator when the external crystal could not output waveform, the switch status can query by the bit[1] of [LOSC_AUTO_SWT_STA_REG](#).

NOTE

If only configuring the bit[15] of [LOSC_CTRL_REG](#), the clock source status bit cannot be changed after the auto switch is valid, because the two functions are independent.

Here is the basic code samples.

```
Write (0x16aa4000,LOSC_Ctrl); //Write key field  
Write (0x16aa4001,LOSC_Ctrl); //Select the external 32K clock
```

3.14.4.2 RTC Calendar

Step 1 Write time initial value: Write the current time to [RTC DAY REG](#) and [RTC HH MM SS REG](#).

Step 2 After updated time, the RTC restarts to count again. The software can read the current time anytime.

NOTE

- The RTC can only provide day counter, so the current day counter need be converted to year, month, day and week by software.
- Ensure the bit[8:7] of LOSC_CTRL_REG is 0 before the next time configuration is performed.

Here is the basic code samples.

For example: set time to 21st, 07:08:09 and read it.

```
RTC_DAY_REG = 0x00000015;
```

```
RTC_HH_MM_SS_REG = 0x00070809; //0000 0000 000|0 0000(Hour) 00|00 0000(Minute) 00|00 0000(Second)
```

```
Read (RTC_DAY_REG);
```

```
Read (RTC_HH_MM_SS_REG);
```

3.14.4.3 Alarm0

Step 1 Enable alram0 interrupt by writing [ALARMO IRQ EN](#).

Step 2 Set the counter comparator, write the count-down day, hour, minute, second number to [ALARMO DAY SET REG](#) and [ALARMO HH-MM-SS SET REG](#).

Step 3 Enable alarm0 function by writing [ALARMO ENABLE REG](#), then the software can query alarm count value in real time by [ALARMO DAY SET REG](#) and [ALARMO HH-MM-SS SET REG](#). When the setting time reaches, [ALARMO IRQ STA REG](#) is set to 1 to generate interrupt.

Step 4 After enter the interrupt process, write [ALARMO IRQ STA REG](#) to clear the interrupt pending, and execute the interrupt process.

Step 5 Resume the interrupt and continue to execute the interrupted process.

Step 6 The power-off wakeup is generated via SoC hardware and PMIC, the software only needs to set the pending condition of alarm0, and set [ALARM CONFIG REG](#) to 1.

4 Video and Graphics

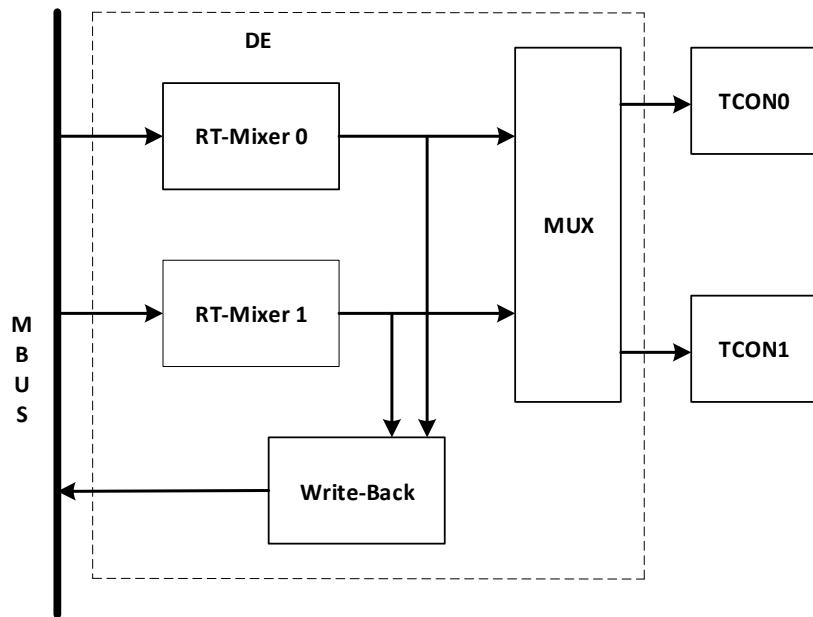

4.1 DE

The Display Engine (DE) is a hardware composer to transfer image layers from a local bus or a video buffer to the LCD interface. The DE supports four overlay windows to blend, and supports image post-processing in the video channel. The block diagram of DE is shown in Figure 4-1.

The DE has the following features:

- Output size up to 2048 x 2048
- Four alpha blending channels for main display, three channels for aux display
- Four overlay layers in each channel, and has a independent scaler
- Potter-duff compatible blending operation
- Supports input format Semi-planar YUV422/YUV420/YUV411 and Planar YUV422/YUV420/YUV411, ARGB8888/XRGB8888/RGB888/ARGB4444/ARGB1555/RGB565/palette
- Supports SmartColor2.0 for excellent display experience
 - Adaptive detail/edge enhancement
 - Adaptive color enhancement
 - Adaptive contrast enhancement and fresh tone rectify
- Supports write back for aux display

Figure 4-1 DE Block Diagram

4.2 DI

The De-interlacer (DI) converts the interlaced input video frame to progressive video frame.

The DI has the following features:

- Supports YUV420 (Planar/NV12/NV21) and YUV422 (Planar/NV16/NV61) data format
- Supports video resolution from 32 x 32 to 2048 x 1280 pixel
- Supports Inter-field interpolation/motion adaptive de-interlace method
- Performance: module clock 600M for 1080p@60Hz YUV420

4.3 G2D

The Graphic 2D (G2D) engine is hardware accelerator for 2D graphic.

The G2D has the following features:

- Supports layer size up to 2048 x 2048 pixels
- Supports pre-multiply alpha image data
- Supports color key
- Supports two pipes Porter-Duff alpha blending
- Supports multiple video formats 4:2:0, 4:2:2, 4:1:1 and multiple pixel formats (8/16/24/32 bits graphics layer)
- Supports memory scan order option
- Supports any format convert function
- Supports 1/16x to 32x resize ratio
- Supports 32-phase 8-tap horizontal anti-alias filter and 32-phase 4-tap vertical anti-alias filter
- Supports window clip
- Supports FillRectangle, BitBlit, StretchBlit and MaskBlit
- Supports horizontal and vertical flip, clockwise 0/90/180/270 degree rotate for normal buffer
- Supports horizontal flip, clockwise 0/90/270 degree rotate for LBC buffer

4.4 Video Decoding

4.4.1 Overview

The Video Decoding consists of Video Control Firmware (VCF) running on ARM processor and embedded hardware Video Engine (VE). VCF gets the bitstream from topper software, parses bitstream, invokes the Video Engine, and generates the decoding image sequence. The decoder image sequence is transmitted by the video output controller to the display device under the control of the topper software.

The Video Decoding has the following features:

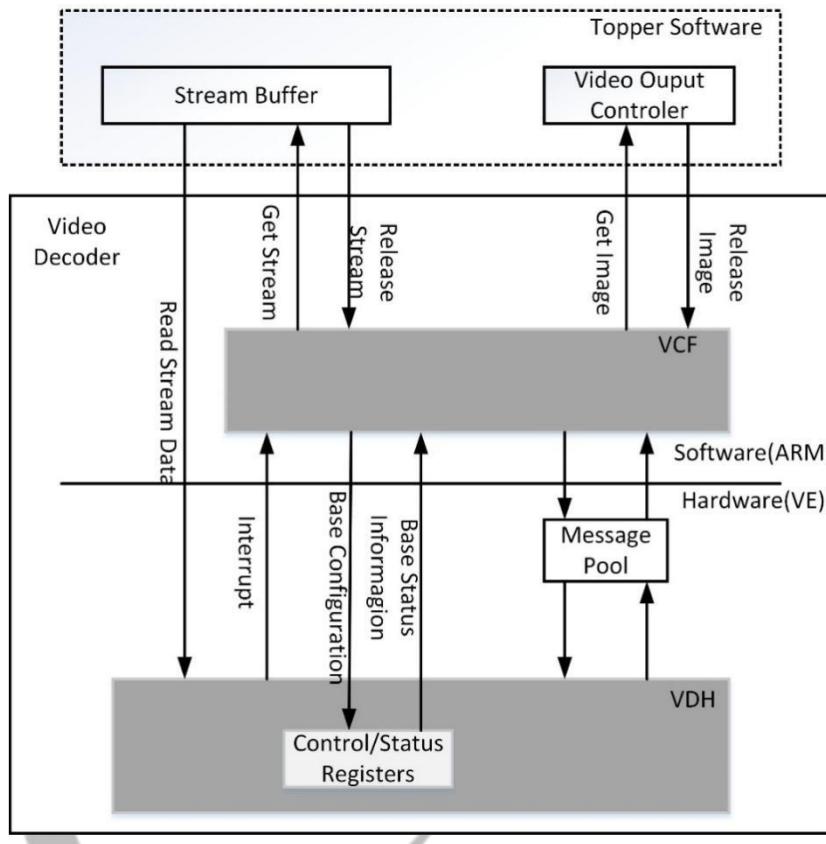

- Supports H.265 MP@L4.1
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports H.264 BP/MP/HP@L4.2
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports H.263 BP
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports MPEG-4 SP/ASP L5
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports MPEG-2 MP/HL
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports MPEG-1 MP/HL
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports JPEG/Xvid/Sorenson Spark
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports MJPEG

- Maximum video resolution: 1920 x 1080
- Maximum decoding rate: 60 Mbit/s, 1080p@30fps

4.4.2 Block Diagram

The functional block diagram of the Video Decoding is as follows.

Figure 4-2 Video Decoding Block Diagram

4.5 Video Encoding

4.5.1 Overview

The Video Encoding supports JPEG/MJPEG encoding (JPGE).

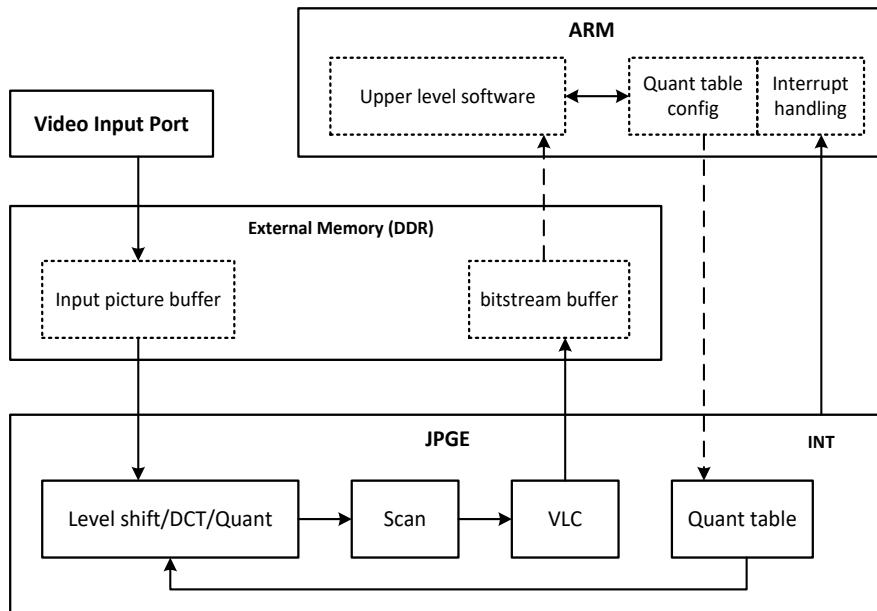

The JPGE is a high-performance JPEG encoder implemented by using hardware. It supports 64-megapixel snapshot or HD MJPEG encoding.

The JPGE has the following features:

- Supports ISO/IEC 10918-1 (CCITT T.81) baseline process (DCT sequential) encoding
- Encodes the pictures in the chrominance sampling format of YCbCr4:2:0 and YCbCr4:2:2
- Supports multiple input picture formats:
 - Semi-planar YCbCr4:2:0
 - Semi-planar YCbCr4:2:2
- Supports JPEG encoding with the performance of 1080p@60fps
- Supports configurable picture resolutions
 - Minimum picture resolution: 192 x 96
 - Maximum picture resolution: 4096 x 4096
- Supports the picture width or height step of 8
- Supports configurable quantization tables for the Y component, Cb component and Cr component respectively
- Supports OSD front-end overlapping
 - OSD overlaying before encoding for a maximum of 16 regions
 - OSD overlaying with any size and at any position (within the size and position range of the picture)
 - 16-level alpha blending
 - OSD overlaying control (enabled or disabled)
- Supports the color-to-gray function
- Supports the MJPEG output bit rate ranging from 2 kbit/s to 60 Mbit/s

4.5.2 Block Diagram

The functional block diagram of the JPGE is as follows.

Figure 4-3 JPGE Block Diagram

The JPGE realizes various protocol processing with large computation such as OSD, level shift, DCT, quantization, scanning, VLC encoding, and stream generation. The ARM software completes the encoding control processing such as quantization table configuration and interrupt processing.

Before the JPGE starts encoding, the software allocates two types of buffers mainly in the external DDR SDRAM:

- **Input picture buffer**

The JPGE reads the source pictures to be encoded from this buffer during encoding. This buffer is generally written by the Video Input Port module.

- **Stream buffer**

This buffer stores encoded streams. The JPGE writes streams to this buffer during encoding. This buffer is read by software.

5 Video Output Interfaces

5.1 TCON LCD

5.1.1 Overview

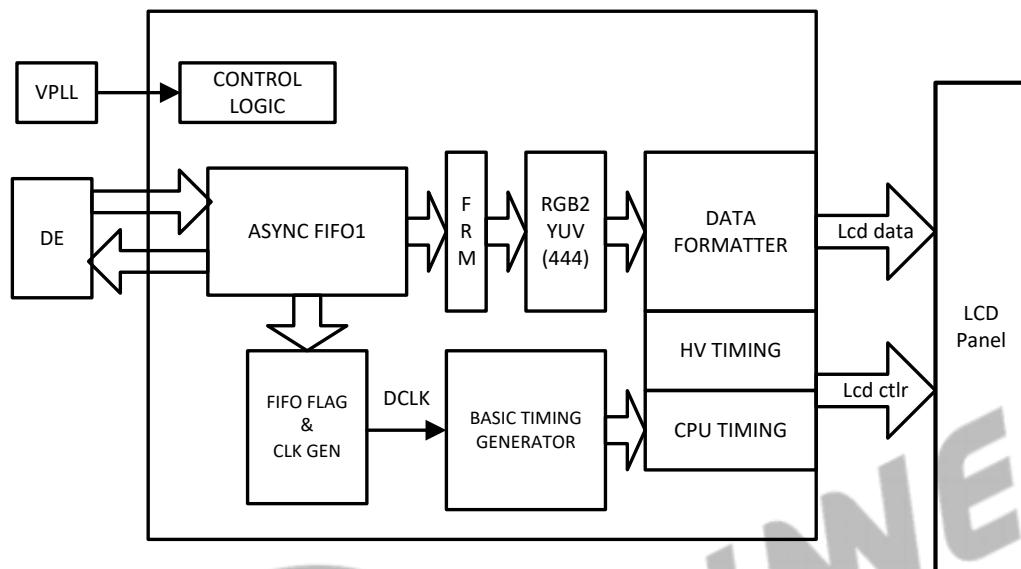

The Timing Controller_LCD (TCON_LCD) is a module that processes video signals received from system through a complicated arithmetic and then generates control signals and transmits them to the LCD panel driver IC.

The TCON_LCD includes the following features:

- Supports RGB interface with DE/SYNC mode, up to 1920 x 1080@60fps
- Supports serial RGB/dummy RGB interface, up to 800 x 480@60fps
- Supports LVDS interface with dual link, up to 1920 x 1080@60fps
- Supports LVDS interface with single link, up to 1366 x 768@60fps
- Supports i8080 interface, up to 800 x 480@60fps
- Supports BT656 interface for NTSC and PAL
- Supports RGB666 and RGB565 with dither function
- Supports Gamma correction with R/G/B channel independence

5.1.3.3 HV interface (Sync+DE mode)

HV I/F is also known as Sync + DE mode, which is widely used in TFT LCD module for PMP/MP4 applications.

Its signals are define as:

Table 5-4 HV Panel Signals

Signal Name	Description	Type
Vsync	Vertical sync, indicates one new frame	O
Hsync	Horizontal sync, indicates one new scan line	O
DCLK	Dot clock, pixel data are sync by this clock	O

Its logic is:

F = "0" for Field 1 F = "1" for Field 2

V = "1" during vertical blanking

H = "0" at SAV H = "1" at EAV

P3-P0 = protection bits

$$P3 = V \oplus H$$

$$P2 = F \oplus H$$

$$P1 = F \oplus V$$

$$P0 = F \oplus V \oplus H$$

Where \oplus represents the exclusive-OR function.

The 4 byte SAV/EAV sequence is as follows.

Table 5-6 EAV and SAV Sequence

5.1.3.5 i8080 Interface

The i8080 I/F LCD panel is most common interface for small size, low resolution LCD panels. The CPU control signals are active low.

Table 5-7 CPU Panel Signals

Signal Name	Description	Type
CS	Chip select, active low	O
WR	Write strobe, active low	O
RD	Read strobe, active low	O
A1	Address bit, controlled by "LCD_CPUI/F" BIT26/25	O
D[23..0]	Digital RGB output signal	I/O

The following figure relationship between basic timing and CPU timing. WR is 180° delay of DCLK; CS is active when pixel data is valid; RD is always set to 1; A1 is set by "LCD_CPUI/F".

Figure 5-4 i8080 Interface Timing

When CPU I/F is in IDLE state, it can generate WR/RD timing by setting “**Lcd_CPUI/F**”. The CS strobe is one DCLK width, and the WR/RD strobe is half DCLK width.

5.1.3.6 LVDS Interface

Table 5-8 LVDS Panel Signals

Signal Name	Description	Type
CKP	The positive port of clock	O
CKN	The negative port of clock	O
D0P	The positive port of data channel 0	O

5.1.3.7 Clock Sources

The following table describes the clock sources of TCON_LCD. Table 5-9 describes the clock sources of TCON_LCD.

Table 5-9 TCON_LCD Clock Sources

Clock Sources	Description
PLL_VIDEO0(1X)	By default, PLL_VIDEO0(4X) is 1188 MHz, PLL_VIDEO0(1X) is 297 MHz
PLL_VIDEO0(4X)	

Clock Sources	Description
PLL_VIDEO1(1X)	
PLL_VIDEO1(4X)	By default, PLL_VIDEO1(4X) is 1188 MHz, PLL_VIDEO1(1X) is 297 MHz
PLL_PERI(2X)	By default, PLL_PERI(2X) is 1.2 GHz
PLL_AUDIO1(DIV2)	By default, PLL_AUDIO1 is 3072 MHz, PLL_AUDIO1(DIV2) is 1536 MHz

5.1.3.8 RGB Gamma Correction

Function: This module correct the RGB input data of DE.

A 256*8*3 Byte register file is used to store the gamma table.

Table 5-10 RGB Gamma Correction Table

Offset	Value
0x400	{ B0[7:0], G0[7:0], R0[7:0] }
0x404	{ B1[7:0], G1[7:0], R1[7:0] }
.....
0x7FC	{ B255[7:0], G255[7:0], R255[7:0] }

5.1.3.9 CEU Module

This module enhances color data from DE .

$$R' = Rr * R + Rg * G + Rb * B + Rc$$

$$G' = Gr * R + Gg * G + Gb * B + Gc$$

$$B' = Br * R + Bg * G + Bb * B + Bc$$

NOTE

Rr, Rg, Rb, Gr, Gg, Gb, Br, Bg, Bb s13 (-16, 16)

Rc, Gc, Bc s19 (-16384, 16384)

R, G, B u8 [0-255]

R' has the range of [Rmin ,Rmax]

G' has the range of [Rmin ,Rmax]

B' has the range of [Rmin ,Rmax]

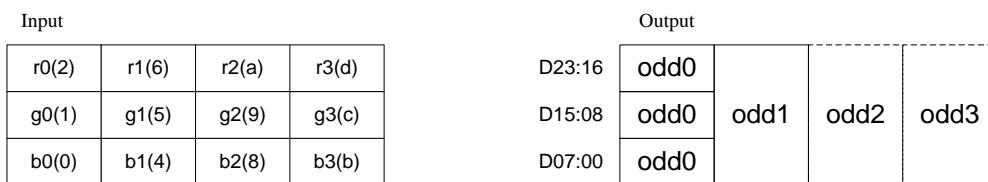

5.1.3.10 CMAP Module

Function: This module map color data from DE.

Every 4 input pixels are as a unit. A unit is divided into 12 bytes. Output byte can select one of those 12 bytes.

Note that even line and odd line can be different, and output can be 12 bytes (4 pixels) or reduce to 6 bytes (2 pixels).

5.1.3.12 MIPI DSI

The requirements on MIPI DSI mode are as follows.

- (1). When using MIPI DSI as display interface, the data clk of TCON needs be started firstly.
- (2). When it is used with DSI video mode, the setting of block space needs to meet the following relationship.

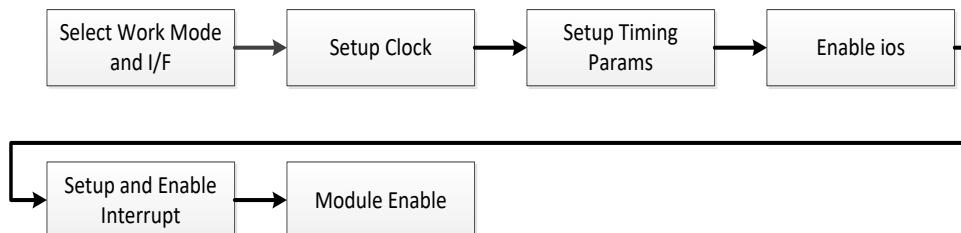

Figure 5-10 The Data Timing of MIPI DSI Video Mode

5.1.4 Programming Guidelines

5.1.4.1 HV Mode Configuration Process

Figure 5-11 HV Mode Initial Process

(1) Parallel RGB

Step 1 Select HV interface type

Configure LCD_CTL_REG[LCD_IF] (reg0x40) to 0 to select HV (Sync+DE) mode, and configure LCD_HV_IF_REG[HV_MODE] (reg0x58) to 0 to select 24bit/1cycle parallel mode.

```
lcd_dev[sel]->lcd_ctl.lcd_if = HV(Sync+DE);
```

```
lcd_dev[sel]->lcd_ctl.src_sel = src; //src = DE/color/grayscale/...
```

```
lcd_dev[sel]->lcd_hv_ctl.hv_mode = 24bit/1cycle parallel mode;
```

Step 2 Clock configuration

NOTE

- In parallel RGB mode, the displayed pixel clock (pixel_CLK) is required to be consistent with the DCLK, the pixel_clk(pixel_clk=Ht*Vt*frame rate) is decided by external LCD.
- When using phase adjustment function, the LCD_IO_POL_REG.DCLK_SEL (reg0x88) selects dclk0–2 of different phase, and LCD_IO_POL_REG.IO2_INV can achieve 180°phase delay.

Configure corresponding frequency by setting PLL_VIDEO0/1 register, and configure TCON LCD0 Clock register.

Configure internal frequency division of TCON_LCD. Based on clock source of TCON and DCLK clock ratio, configure LCD_DCLK_REG[LCD_DCLK_DIV]. If using phase adjustment function, LCD_DCLK_REG[LCD_DCLK_EN] needs be set, usually is 0xf. When the dclk1 and dclk2 in LCD_DCLK_REG[LCD_DCLK_EN] are used, the value of LCD_DCLK_REG[LCD_DCLK_DIV] needs no less than 6.

```
lcd_dev[sel]->lcd_dclk.dclk_en = en;
```

```
lcd_dev[sel]->lcd_dclk.dclk_div = div;
```

Step 3 Set sequence parameters

The sequence parameters include x,ht,hbp,hspw,y,vt,vbp,vspw, and correspond to LCD_BASE_REG from reg0x48 to reg 0x54. Note that hbp includes hspw, and vbp includes vspw. And LCD_BASE2_REG.VT needs be set to the twice of the actual value.

```
lcd_dev[sel]->lcd_basic0.x = x-1;
```

```
lcd_dev[sel]->lcd_basic0.y = y-1;
```

```
lcd_dev[sel]->lcd_basic1.ht = ht-1;
```

```
lcd_dev[sel]->lcd_basic1.hbp = hbp-1;
```

```
lcd_dev[sel]->lcd_basic2.vt = vt*2;
```

```
lcd_dev[sel]->lcd_basic2.vbp = vbp-1;  
lcd_dev[sel]->lcd_basic3.hspw = hspw-1;  
lcd_dev[sel]->lcd_basic3.vspw = vspw-1;
```

Step 4 Open IO output

Set the corresponding data IO enable and control signal IO enable of LCD_IO_TRI_REG (reg0x8C) to 0 to start enable. Note that except the internal IO of TCON_LCD, the external GPIO mapping needs to be set to LCD mode.

When some control signals require polarity reversal, it can realize by setting LCD_IO_POL_REG.IO0~3_INV (reg0x88).

Step 5 Set and open interrupt function

The LCD_GINT0_REG (reg0x4) controls interrupt mode and flag, and the LCD_GINT1_REG (reg0x8) sets the interrupt line position of Line interrupt mode.

V interrupt:

```
lcd_dev[sel]->lcd_gint0.vb_en = 1;
```

Line interrupt:

```
lcd_dev[sel]->lcd_gint1.lcd_line_int_num = line;
```

```
lcd_dev[sel]->lcd_gint0.line_en = 1;
```

Step 6 Open module enable

Enable LCD_CTL_REG.LCD_EN (reg0x40) and LCD_GCTL_REG.LCD_EN (reg0x00).

```
lcd_dev[sel]->lcd_ctl.lcd_en = 1;
```

```
lcd_dev[sel]->lcd_gctl.lcd_en = 1;
```

(2) Serial RGB

The serial RGB mode is consistent with parallel RGB mode, the main difference is the definition of clock and the sequence of serial data. The difference is as follows.

Step 1 Select HV interface type

Set LCD_CTL_REG.LCD_IF (reg0x40) to 0 to select HV(Sync+DE) mode; set LCD_HV_IF_REG.HV_MODE (reg0x58) to select 8bit/3cycle RGB serial mode (RGB888), 8bit/4cycle Dummy RGB mode (DRGB) or 8bit/4cycle RGB Dummy mode (RGBD).

```
lcd_dev[sel]->lcd_ctl.lcd_if = HV(Sync+DE);  
lcd_dev[sel]->lcd_ctl.src_sel = src; //src = DE/color/grayscale/...
```

`lcd_dev[sel]->lcd_hv_ctl.hv_mode = Serial mode;`

Step2、Step3: Set clock and sequence parameters

In serial RGB mode, DCLK is the transfer clock of each byte data. In the same resolution, pixel_clk of serial RGB is three times of its clock in parallel RGB, and ht,hbp,hspw own the same conversion relation. When display is split into odd field and even field, LCD_BASE2_REG.VT needs not to be set to the twice of the actual value.

`lcd_dev[sel]->lcd_basic2.vt = vt;`

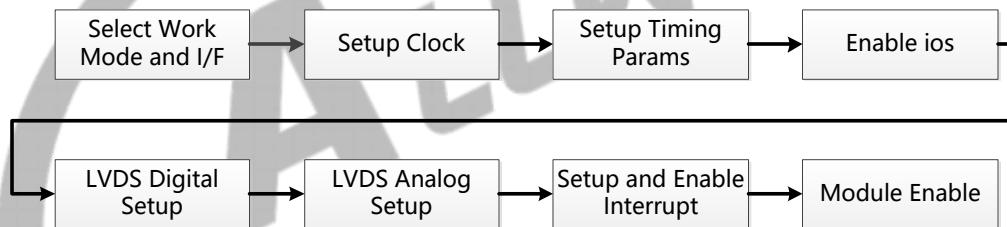

Set `LCD_HV_IF_REG.RGB888_ODD_ORDER/LCD_HV_IF_REG.RGB888_ODD_EVEN` to select RGB output sequence of the selected odd and even lines.

`lcd_dev[lcd_sel]->lcd_hv_ctl.srgb_seq_even = seq_even;`

`lcd_dev[lcd_sel]->lcd_hv_ctl.srgb_seq_odd = seq_odd;`

5.1.4.2 LVDS Mode Configuration Process

Figure 5-12 LVDS Mode Configuration Process

The LVDS interface configuration process is similar to the parallel mode of HV mode, and adds the digital/analog configuration of LVDS interface.

Step 1 Same as in step1 of parallel mode

Step 2 Clock configuration

NOTE

In parallel mode, the displayed pixel clock (pixel_CLK) is required to be consistent with the DCLK, $\text{pixel_clk} = \text{Ht} * \text{Vt} * \text{frame rate}$.

- Configure `LCD_DCLK_REG.LCD_DCLK_DIV` (reg0x44) to 7 after DCLK is determined;
- Configure the PLL clock in CCU based on proportional relationship;

- Release the LVDS reset of TCON LCD BUS GATING RESET register;
- Other configurations remain unchanged.

```
lcd_dev[sel]->lcd_dclk.dclk_en = en;
```

```
lcd_dev[sel]->lcd_dclk.dclk_div = 7;
```

Step 3 Same as in step3 of parallel mode

Step 4 Same as in step4 of parallel mode

Step 5 LVDS digital logic configuration

Includes clock source select of module, LVDS link number, data mode and bit width configuration.

- Configure LCD_LVDS_IF_REG.LCD_LVDS_CLK_SEL (reg0x84) to set LCD CLK;
- Configure LCD_LVDS_IF_REG.LCD_LVDS_LINK to set the required LVDS port number;
- Configure LCD_LVDS_IF_REG.LCD_LVDS_MODE to set JEDIA and NS mode;
- Configure LCD_LVDS_IF_REG.LCD_LVDS_BITWIDTH to select 24-bit or 18-bit width;
- Lastly configure LCD_LVDS_IF_REG.LCD_LVDS_EN to start LVDS mode.

```
lcd_dev[sel]->lcd_lvds_ctl.lvds_link = link_num-1;
```

```
lcd_dev[sel]->lcd_lvds_ctl.lvds_mode = mode;
```

```
lcd_dev[sel]->lcd_lvds_ctl.lvds_bitwidth = bitwidth;
```

```
lcd_dev[sel]->lcd_lvds_ctl.lvds_clk_sel = clk_src;
```

```
lcd_dev[sel]->lcd_lvds_ctl.lvds_en = 1;
```

NOTE

If configuring the same source data output mode of dual link, except the reg0x84 register of TCON_LCD0 needs be configured, the LCD_LVDS_IF_REG.LCD_LVDS_CLK_SEL, LCD_LVDS_IF_REG.LCD_LVDS_LINK, LCD_LVDS_IF_REG.LCD_LVDS_MODE, and LCD_LVDS_IF_REG.LCD_LVDS_BITWIDTH of the reg0x244 register need be configured.

Step 6 LVDS controller configuration

**NOTE**

The TCON LCD0 PHY0 is controlled by COMBO_PHY_REG (reg0x1110, reg0x1114). The TCON LCD0 PHY1 is controlled by LCD_LVDS0_ANA_REG (reg0x220).

For PHY0:

- Configure the reg_verf1p6 (differential mode voltage) in reg0x1114 to 4;
- Configure the reg_vref0p8 reg0x1114 (common mode voltage) in reg0x1114 to 3;
- Start en_cp, en_mipi, en_lvds, and en_combaldo in reg0x1110, in turn.

For PHY1:

The LVDS analog configuration process is to start clock and data channel, and set the common mode and differential mode voltage, and start module power.

- Configure LVDS_HPREN_DRVC and LVDS_HPREN_DRV. When LVDS signal is 18-bit, LVDS_HPREN_DRV=0x7; when LVDS signal is 24-bit, LVDS_HPREN_DRV=0xF;
- Configure LVDS0_REG_C (differential mode voltage) to 4;
- Configure LVDS0_REG_V (common mode voltage) to 3;
- Lastly, start module voltage, and enable EN_LVDS and EN_24M.

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.en_drvd = 0x7; //18-bit=0x7, 24-bit=0xf
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.en_drvc = 1;
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.diff_level = diff;
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.com_level = com;
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.dual_src = link_src;
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.en_24M = 1;
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.en_lvds = 1;
```

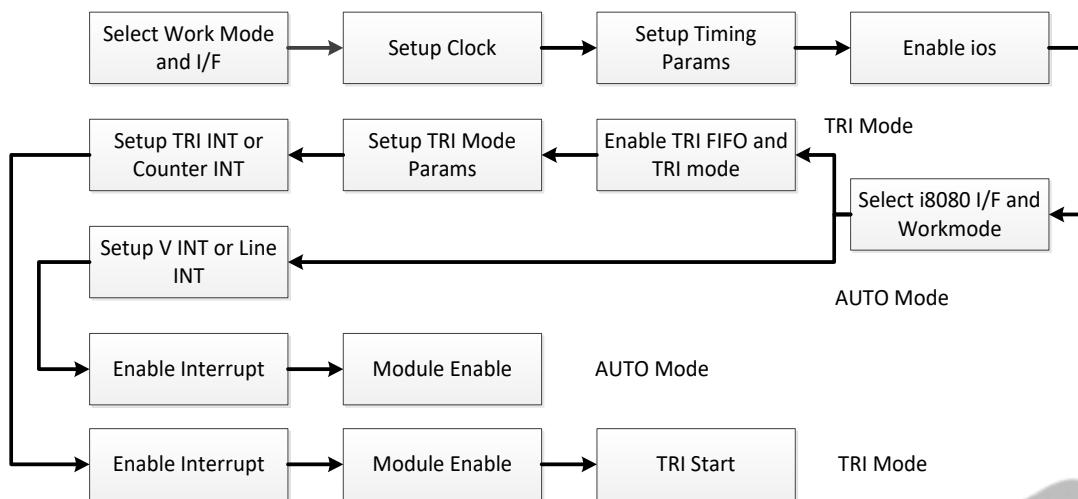

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.en_mb = 1;
```

Step 7 Same as in step5 of parallel mode

Step 8 Same as in step6 of parallel mode

5.1.4.3 i8080 Mode Configuration Process

Figure 5-13 i8080 Mode Initial Process

- Step 1** Select i8080 interface type.
- Step 2** The step is the same as HV mode, but pulse adjustment function is invalid.
- Step 3** The step is the same as HV mode. When using TRI mode, it is best to configure LCD timing parameters in HV mode , or a handful of functions such as CMAP will not be able to apply.
- Step 4** The step is the same as HV mode.
- Step 5** Select type and operating mode of i8080, the operating mode includes TRI mode and AUTO mode, and the two operating modes are different.

-----For TRI mode-----

- Step 6** Open TRI FIFO switch, and TRI mode function.
- Step 7** Set parameters of TRI mode, including block size, block space and block number.

NOTE

When output interface is parallel mode, then the setting value of block space parameter is not less than 20.

When output interface is 2 cycle serial mode, then the setting value of block space parameter is not less than 40.

When output interface is 3 cycle serial mode, then the setting value of block space parameter is not less than 60.

When output interface is 4 cycle serial mode, then the setting value of block space parameter is not less than 80.

- Step 8** Set the tri interrupt or counter interrupt. When using the two interrupts, mainly in the interrupt service function the tri start operation need be operated (the bit1 of LCD_CPU_IF_REG is set to "1"). If using TE trigger interrupt, you select the external input pin as a trigger signal, the 24-bit for offset 0x8C register is set to "1", to open up input of pad.
- Step 9** Open the total switch of interrupt.
- Step 10** Open the total enable of interrupt.
- Step 11** Operate "tri start" operation (the bit1 of LCD_CPU_IF_REG is set to "1").

For Auto mode

- Step 6** Set and open V interrupt or Line interrupt, the step is the same as HV mode.
- Step 7** Open module total enable.

5.2 TCON TV

5.2.1 Overview

The Timing Controller_TV (TCON_TV) is a module that processes video signals received from systems using a complicated arithmetic and then generates control signals and transmits them to the TV panel driver IC.

The TCON_TV includes the following features:

- Supports 10-bit pixel depth YUV444, and HV format output up to 4K@60Hz
- Supports 8-bit pixel depth YUV444, and HV format output up to 4K@60Hz

5.2.2 Functional Description

5.2.2.1 CEU Module

Function: This module enhance color data from DE .

$$R' = Rr * R + Rg * G + Rb * B$$

$$G' = Gr * R + Gg * G + Gb * B$$

$$B' = Br * R + Bg * G + Bb * B$$

Rr, Rg, Rb, ,Gr, Gg, Gb, Br, Bg, Bb bool 0,1

R, G, B u10 [0-1023]

R' have the range of [Rmin ,Rmax]

G' have the range of [Rmin ,Rmax]

B' have the range of [Rmin ,Rmax]

5.3 TV Encoder

5.3.1 Overview

The TV Encoder (TVE) module is a highly programmable digital video encoder supporting worldwide video standards Composite Video Broadcast Signal (CVBS).

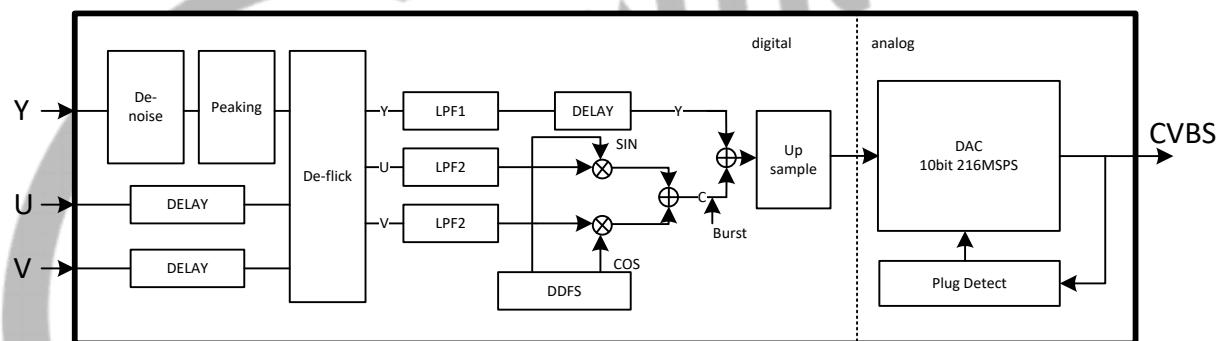

The TVE includes the following features:

- 1-channel CVBS output, supporting PAL-D and NTSC-M
- Plug status auto detecting
- 10 bits DAC output

5.3.2 Block Diagram

Figure 5-14 shows a block diagram of the TVE.

Figure 5-14 TVE Block Diagram

5.3.3 Functional Description

5.3.3.1 External Signals

Table 5-11 describes the external signals of TVE.

Table 5-11 TVE External Signals

Port Name	Description	Type
TVOUT0	TV CVBS output	AO
VCC-TVOUT	TV DAC power	P

5.3.3.2 Clock Sources

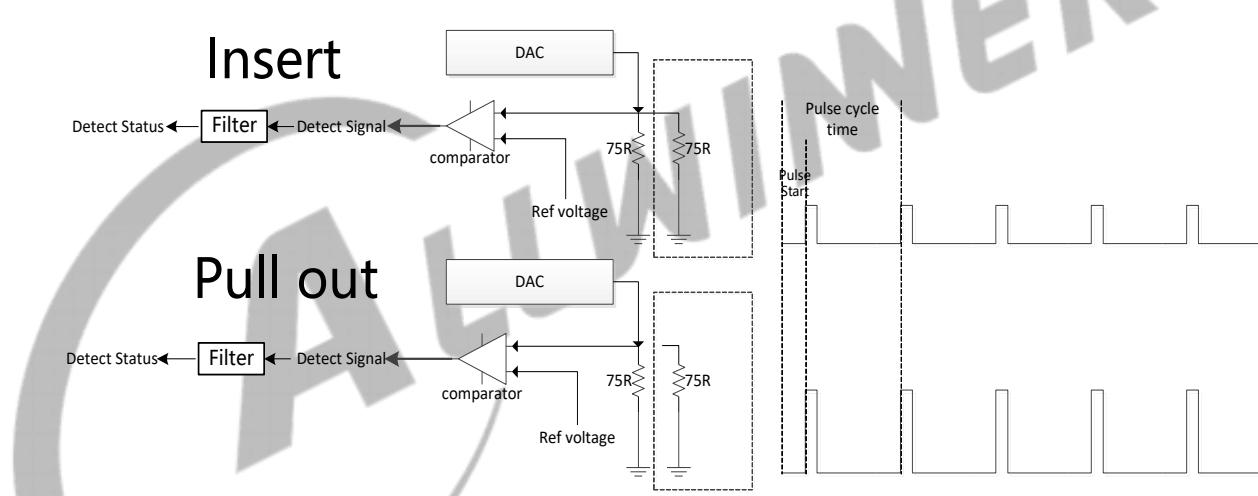

The TVE module requires one clock with 50% duty. Digital circuit and Analog circuit work by this clock. Mode and Clock frequency is shown below.

Table 5-12 TVE Clock Sources

Mode	TVE Clock Frequency
NTSC	216 MHz
PAL	216 MHz

5.3.3.3 Auto Detection Function

Figure 5-15 Auto Detection Function

DAC outputs constant current, when insert, external load is 37.5Ω ; when pull out, external load is 75Ω . The method that comparator judges pin level can detect plug action.

Because plug action may exist jitter, then there need be a filter to filter jitter, the debounce time of filter is set through the bit[3:0] of TV Encoder Auto Detection de-bounce Setting Register.

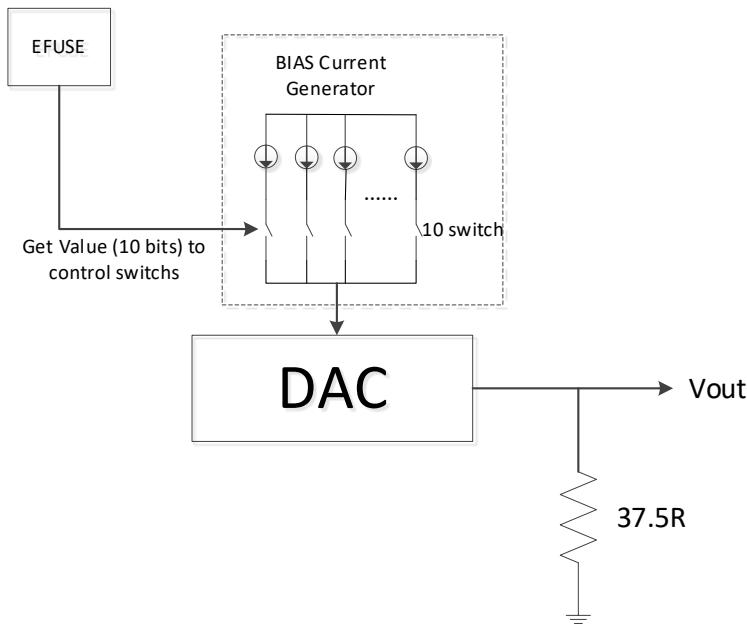

The pulse cycle time can be set through the bit[30:16] of TV Encoder Auto Detect Configuration Register1, the pulse start time can be set through the bit[14:0] of TV Encoder Auto Detect Configuration Register1. The clock sources of the two time are 32KHz clock.

Pulse width is cycle time of 4 clock sources.

Pulse amplitude can be set through the bit[9:0] of TV Encoder Auto Detect Configuration Register0.

5.3.3.4 DAC Calibration Function

Figure 5-16 DAC Calibration Function

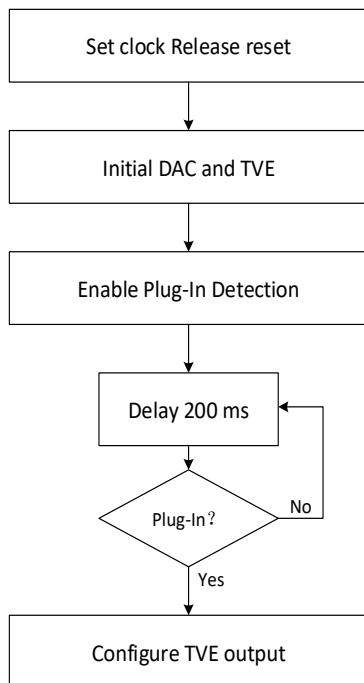

After FT, 10-bit calibration value is burned into efuse. Every time software can read the 10-bit calibration value from efuse, to control BIAS current and BIAS current switch, then a specific BIAS current is generated to calibrate maximum output voltage of DAC.

5.3.4 Programming Guidelines

5.3.4.1 Operating TVE Module

Operate TVE module by the following steps, Figure 5-17 shows the process diagram.

- Step 1** Set CCU clock source for TVE, and release AHB bus, and module reset.
- Step 2** Initial DAC amplitude value from efuse calibration value which has burned.
- Step 3** Enable the plug-in detect function, and detect plug-in status every 200 ms.
- Step 4** When the plug-in has detected, configure TVE module to output mode setting by application.

5.4 MIPI DSI

5.4.1 Overview

The Display Serial Interface is a high-speed interface between a host processor and peripheral devices that adhere to MIPI Alliance specifications for mobile device interfaces. This DSI module is composed of a DSI controller which is compliance with MIPI DSI specification V1.01 and a D-PHY module which is compliance with MIPI DPHY specification V1.00.

The MIPI DSI includes the following features:

- Compliance with MIPI DSI v1.01
- Up to 4 lanes
- Supports 1280 x 720@60fps and 1920 x 1200@60fps
- Supports non-burst mode with sync pulse/sync event and burst mode
- Supports pixel format: RGB888, RGB666, RGB666 loosely packed and RGB565
- Supports continuous lane clock mode and non-continuous lane clock mode
- Compliance with MIPI DCS v1.01, bidirectional communication in LP through data lane 0
- Supports bidirectional communication of all generic commands in LP through data lane 0
- Supports low power data transmission
- Supports ULPS and Escape modes
- Hardware checksum capabilities

6 Video Input Interfaces

6.1 CSIC

6.1.1 Overview

The CMOS Sensor Interface Controller (CSIC) is an image or video data receiver, which can receive image or video data via camera interface and store the data in memory directly.

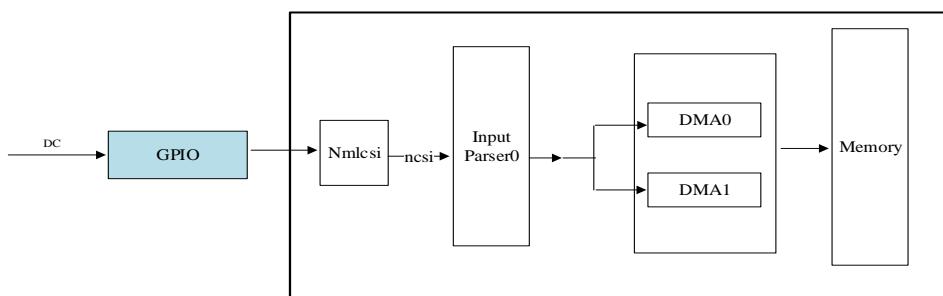

The CSIC includes the following features:

- Supports 8-bit digital camera interface
- Supports BT656 Interface
 - Supports time-multiplexed format
 - Supports dual data rate sample mode with pixel clock up to 148.5 MHz
- Supports BT601 Interface
- Supports crop function
- Supports frame rate down
- Supports 2 DMA for 2 video stream storage
 - Supports de-interlacing for interlace video input
 - Supports conversion from YUV422 to YUV420, YUV422 to YUV400, YUV420 to YUV400
 - Supports horizontal and vertical flip

6.1.3.4 Offset Definition

Offset in horizontal and vertical can be added when receiving image. Unit is pixel.

For YUV422 format, pixel unit is a YU/YV combination.

For YUV420 format, pixel unit is a YU/YV combination in YC line, and only a Y in Y line.

For Bayer and RAW format, pixel unit is a R/G/B single component.

For RGB565, pixel unit is 2 bytes of RGB565 package.

For RGB888, pixel unit is 3 bytes of RGB combination.

6.1.3.5 Flip Definition

Both horizontal and vertical flip are supported at the same time. This function is implemented in the process of each FIFO writing data to memory, only flipping the data of separate FIFO, not changing component to FIFO distribution.

If horizontal flip is enabled, one or more pixels will be took as a unit:

For YUV format, a unit of $Y_0U_0Y_1V_1$ will parser and flip the Y component in one channel, and UV will be treated as a whole. In planar output mode, U and V will be flipped separately. In UV combined output mode, UV will be flipped as a whole. So, a sequence of $Y_1U_0Y_0V_1$ will be.

For Bayer_raw format, situation is much like. A GR/BG sequence will be changed to BG/RG. A unit of square has four pixels.

For RGB565/RGB888, one unit of two/three bytes of component will be flipped with original sequence.

6.1.8.11 0x0038 CSIC DMA Buffer Length Register (Default Value:0x0280_0500)

Offset: 0x0038			Register Name: CSIC_DMA_BUF_LEN_REG
Bit	Read/Write	Default/Hex	Description
31:30	/	/	/
29:16	R/W	0x280	BUF_LEN_C DMA_MODE: Buffer length of chroma C in a line. Unit is byte. LBC_MODE: Buffer length Stride of luminance Y in ONLY Y line. Unit is byte. Only Readable when BUF_LENGTH_CFG_MODE is set 0.
15:14	/	/	/
13:0	R/W	0x500	BUF_LEN DMA_MODE: Buffer length of luminance Y in a line. Unit is byte. LBC_MODE: Buffer length Stride of luminance Y and chroma C in YC line. Unit is byte. Only Readable when BUF_LENGTH_CFG_MODE is set 0.

6.1.8.12 0x003C CSIC DMA Flip Size Register (Default Value:0x02D0_0500)

Offset: 0x003C			Register Name: CSIC_DMA_FLIP_SIZE_REG
Bit	Read/Write	Default/Hex	Description
31:29	/	/	/
28:16	R/W	0x2d0	VER_LEN Vertical line number when in VFLIP mode. Unit is line. Only Readable when FLIP_SIZE_CFG_MODE is set to 0.
15:14	/	/	/
13:0	R/W	0x500	VALID_LEN Valid components of a line when in HFLIP mode. Unit is pixel component. Only Readable when FLIP_SIZE_CFG_MODE is set to 0.

6.1.8.13 0x0040 CSIC DMA Video Input Timeout Threshold0 Register (Default Value:0x0000_0000)

Offset: 0x0040			Register Name: CSIC_DMA_VI_TO_TH0_REG
Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	Video Input Timeout Threshold0 Set VIDEO_INPUT_TO_INT_PD when VI Counter reaches TH0 after VI_TO_CNT_EN is set, the Time Unit is a 12M clock period.

6.1.8.14 0x0044 CSIC DMA Video Input Timeout Threshold1 Register(Default Value:0x0000_0000)

Offset: 0x0044			Register Name: CSIC_DMA_VI_TO_TH1_REG
Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	Video Input Timeout Threshold1 Set VIDEO_INPUT_TO_INT_PD when VI Counter reaches TH1 after getting the first frame has been input, the Time Unit is a 12M clock period.

6.1.8.15 0x0048 CSIC DMA Video Input Timeout Counter Value Register (Default Value:0x0000_0000)

Offset: 0x0048			Register Name: CSIC_DMA_VI_TO_CNT_VAL_REG
Bit	Read/Write	Default/Hex	Description
31:0	R	0x0	Video Input Timeout Counter Value Indicate the current value of Video Input Timeout Counter

6.1.8.16 0x004C CSIC DMA Capture Status Register (Default Value:0x0000_0000)

Offset: 0x004C			Register Name: CSIC_DMA_CAP_STA_REG
Bit	Read/Write	Default/Hex	Description
31:3	/	/	/
2	R	0x0	FIELD_STA The status of the received field 0: Field 0 1: Field 1
1	R	0x0	VCAP_STA Video capture in progress Indicates the CSI is capturing video image data (multiple frames). The bit is set at the start of the first frame after enabling video capture. When software disables video capture, it clears itself after the last pixel of the current frame is captured.
0	R	0x0	SCAP_STA Still capture in progress Indicates the CSI is capturing still image data (single frame). The bit is set at the start of the first frame after enabling still frame capture. It clears itself after the last pixel of the first frame is captured. For CCIR656 interface, if the output format is frame planar YCbCr 420 mode, the frame end means the field2 end, the other frame end means filed end.

6.1.8.17 0x0050 CSIC DMA Interrupt Enable Register (Default Value:0x0000_0000)

Offset: 0x0050			Register Name: CSIC_DMA_INT_EN_REG
Bit	Read/Write	Default/Hex	Description
31:16	/	/	/
15	R/W	0x0	FRM_LOST_INT_EN Set an INT when frame starts with empty Buffer Address FIFO, only use in BUF Address FIFO MODE.
14	R/W	0x0	STORED_FRM_CNT_INT_EN Set an INT when the value of CSIC_DMA_STORED_FRM_CNT reaches CSIC_DMA_STORED_FRM_THRESHOLD, only use in BUF Address FIFO MODE.
13	R/W	0x0	BUF_ADDR_FIFO_INT_EN Set an INT when content in BUF Address FIFO less than CSIC_DMA_BUFA_FIFO_THRESHOLD, only use in BUF Address FIFO MODE.
12	R/W	0x0	VIDEO_INPUT_TO_INT_EN Set an INT when no video input exceeds the setting threshold time
11	R/W	0x0	CLR_FRAME_CNT_INT_EN Set a INT when clear Frame cnt.
10:8	/	/	/
7	R/W	0x0	VS_INT_EN vsync flag The bit is set when vsync come. And at this time load the buffer address for the coming frame. So after this irq come, changing the buffer address could only effect next frame
6	R/W	0x0	HB_OF_INT_EN Hblank FIFO overflow The bit is set when 3 FIFOs still overflow after the hblank.
5	R/W	0x0	LC_INT_EN Line counter flag The bit is set when the specific line has been written to dram every frame. The line number is set in the line counter register.
4	R/W	0x0	FIFO2_OF_INT_EN FIFO 2 overflow The bit is set when the FIFO 2 became overflow.
3	R/W	0x0	FIFO1_OF_INT_EN FIFO 1 overflow The bit is set when the FIFO 1 became overflow.
2	R/W	0x0	FIFO0_OF_INT_EN FIFO 0 overflow The bit is set when the FIFO 0 became overflow.
1	R/W	0x0	FD_INT_EN

Offset: 0x0050			Register Name: CSIC_DMA_INT_EN_REG
Bit	Read/Write	Default/Hex	Description
			<p>Frame done Indicates the CSI has finished capturing an image frame. Applies to video capture mode. The bit is set after each completed frame capturing data is written to buffer as long as video capture remains enabled.</p>
0	R/W	0x0	<p>CD_INT_EN Capture done Indicates the CSI has completed capturing the image data. For still capture, the bit is set when one frame data has been written to buffer. For video capture, the bit is set when the last frame has been written to buffer after video capture has been disabled. For CCIR656 interface, if the output format is frame planar YCbCr 420 mode, the frame end means the field2 end, the other frame end means field end.</p>

6.1.8.18 0x0054 CSIC DMA Interrupt Status Register (Default Value:0x0000_0000)

Offset: 0x0054			Register Name: CSIC_DMA_INT_STA_REG
Bit	Read/Write	Default/Hex	Description
31:16	/	/	/
15	R/W1C	0x0	<p>FRM_LOST_INT_PD Set an INT when frame starts with empty Buffer Address FIFO, only use in BUF Address FIFO MODE.</p>
14	R/W1C	0x0	<p>STORED_FRM_CNT_INT_PD Set an INT when the value of CSIC_DMA_STORED_FRM_CNT reaches CSIC_DMA_STORED_FRM_THRESHOLD, only use in BUF Address FIFO MODE.</p>
13	R/W1C	0x0	<p>BUF_ADDR_FIFO_INT_PD Set an INT when content in BUF Address FIFO less than CSIC_DMA_BUFA_FIFO_THRESHOLD, only use in BUF Address FIFO MODE.</p>
12	R/W1C	0x0	<p>VIDEO_INPUT_TO_INT_PD Set an INT Pending when no video input exceeds the setting threshold time.</p>
11	R/W1C	0x0	<p>CLR_FRAME_CNT_INT Set a INT when clear Frame cnt.</p>
10:8	/	/	/
7	R/W1C	0x0	<p>VS_PD vsync flag</p>
6	R/W1C	0x0	LI_OF_PD

Offset: 0x0054			Register Name: CSIC_DMA_INT_STA_REG
Bit	Read/Write	Default/Hex	Description
			Line information FIFO (16 lines) overflow
5	R/W1C	0x0	LC_PD Line counter flag
4	R/W1C	0x0	FIFO2_OF_PD FIFO 2 overflow
3	R/W1C	0x0	FIFO1_OF_PD FIFO 1 overflow
2	R/W1C	0x0	FIFO0_OF_PD FIFO 0 overflow
1	R/W1C	0x0	FD_PD Frame done
0	R/W1C	0x0	CD_PD Capture done

6.1.8.19 0x0058 CSIC DMA Line Counter Register (Default Value:0x0000_0000)

Offset: 0x0058			Register Name: CSIC_DMA_LINE_CNT_REG
Bit	Read/Write	Default/Hex	Description
31:13	/	/	/
12:0	R/W	0x0	LINE_CNT_NUM The LINE_CNT_NUM value is set by user, when internal line counter reach the set value, the LC_PD will be set.

6.1.8.20 0x005C CSIC DMA Frame Counter Register (Default Value:0x0001_0000)

Offset: 0x005C			Register Name: CSIC_DMA_FRM_CNT_REG
Bit	Read/Write	Default/Hex	Description
31	R/W1C	0x0	FRM_CNT_CLR When the bit set to 1, Frame cnt is cleared to 0.
30:16	R/W	0x1	PCLK_DMA_CLR_DISTANCE Frame cnt clear cycle $N*T_{SYNC}$
15:0	R	0x0	FRM_CNT Counter value of frame. When frame done comes, the internal counter value add 1, and when the reg full, it is cleared to 0. When parser sent a sync signal, it is cleared to 0.

6.1.8.21 0x0060 CSIC DMA Frame Clock Counter Register (Default Value:0x0000_0000)

Offset: 0x0060			Register Name: CSIC_DMA_FRM_CLK_CNT_REG
Bit	Read/Write	Default/Hex	Description
31:24	/	/	/
23:0	R	0x0	FRM_CLK_CNT Counter value between every frame. For instant hardware frame rate statics. The internal counter is added by one every 12 MHz clock cycle. When frame done or vsync comes, the internal counter value is sampled to FRM_CLK_CNT, and cleared to 0.

6.1.8.22 0x0064 CSIC DMA Accumulated and Internal Clock Counter Register (Default Value:0x0000_0000)

Offset: 0x0064			Register Name: CSIC_DMA_ACC_ITNL_CLK_CNT_REG
Bit	Read/Write	Default/Hex	Description
31:24	R/WC	0x0	ACC_CLK_CNT The accumulated value of FRM_CLK_CNT for software frame rate statics. Every interrupt of frame is done, the software checks this accumulated value and clears it to 0. If the ACC_CLK_CNT is larger than 1, the software has lost frame. When frame done or vsync comes, ACC_CLK_CNT = ACC_CLK_CNT + 1, and cleared to 0 when writing this register.
23:0	R	0x0	ITNL_CLK_CNT The instant value of internal frame clock counter. When frame done interrupt comes, the software can query this counter for judging whether it is the time for updating the double buffer address registers.

6.1.8.23 0x0068 CSIC DMA FIFO Statistic Register (Default Value:0x0000_0000)

Offset: 0x0068			Register Name: CSIC_DMA_FIFO_STAT_REG
Bit	Read/Write	Default/Hex	Description
31:30	/	/	/
29:16	R	0x0	Line Index Indicates the line index in current vsync.
15:13	/	/	/
12:0	R	0x0	FIFO_FRM_MAX Indicates the maximum depth of FIFO being occupied for whole frame. Update at every vsync or framedone.

6.1.8.24 0x006C CSIC DMA FIFO Threshold Register (Default Value:0x0000_0400)

Offset: 0x006C			Register Name: CSIC_DMA_FIFO_THRS_REG
Bit	Read/Write	Default/Hex	Description
31:12	/	/	/
11:0	R/W	0x400	FIFO_THRS When FIFO occupied memory exceed the threshold, dram frequency can not change.

6.1.8.25 0x0070 CSIC DMA PCLK Statistic Register (Default Value:0x0000_7FFF)

Offset: 0x0070			Register Name: CSIC_DMA_PCLK_STAT_REG
Bit	Read/Write	Default/Hex	Description
31	/	/	/
30:16	R	0x0	PCLK_CNT_LINE_MAX Indicates maximum pixel clock counter value for each line. Update at every vsync or framedone.
15	/	/	/
14:0	R	0x7FFF	PCLK_CNT_LINE_MIN Indicates minimum pixel clock counter value for each line. Update at every vsync or framedone.

6.1.8.26 0x0080 CSIC DMA BUF Address FIFO0 Entry Register (Default Value:0x0000_0000)

Offset: 0x0080			Register Name: CSIC_DMA_BUF_ADDR_FIFO0_ENTRY_REG
Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	CSIC_DMA_BUF_ADDR_FIFO0_ENTRY FIFO Entry of Buffer Address FIFO0 for input frames to be stored, only used in Buffer Addr FIFO Mode

6.1.8.27 0x0084 CSIC DMA BUF Address FIFO1 Entry Register (Default Value:0x0000_0000)

Offset: 0x0084			Register Name: CSIC_DMA_BUF_ADDR_FIFO1_ENTRY_REG
Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	CSIC_DMA_BUF_ADDR_FIFO1_ENTRY FIFO Entry of Buffer Address FIFO1 for input frames to be stored, only used in Buffer Addr FIFO Mode.

6.1.8.28 0x0088 CSIC DMA BUF Address FIFO2 Entry Register (Default Value:0x0000_0000)

Offset: 0x0088			Register Name: CSIC_DMA_BUF_ADDR_FIFO2_ENTRY_REG
Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	CSIC_DMA_BUF_ADDR_FIFO2_ENTRY FIFO Entry of Buffer Address FIFO2 for input frames to be stored, only used in Buffer Addr FIFO Mode.

6.1.8.29 0x008C CSIC DMA BUF Threshold Register (Default Value:0x0020_0000)

Offset: 0x008C			Register Name: CSIC_DMA_BUF_TH_REG
Bit	Read/Write	Default/Hex	Description
31:21	/	/	/
21:16	R/W	0x20	CSIC_DMA_STORED_FRM_THRESHOLD when stored frame counter value reaches the threshold , counter is cleared to 0 , only used in Buffer Addr FIFO Mode.
15:6	/	/	/
5:0	R/W	0x0	CSIC_DMA_BUF_ADDR_FIFO_THRESHOLD when content in Buffer Address FIFO less than the threshold, an interrupt is set, only used in Buffer Addr FIFO Mode.

6.1.8.30 0x0090 CSIC DMA BUF Address FIFO Content Register (Default Value:0x0000_0000)

Offset: 0x0090			Register Name: CSIC_DMA_BUF_ADDR_FIFO_CON_REG
Bit	Read/Write	Default/Hex	Description
31:22	/	/	/
21:16	RO	0x0	CSIC_DMA_BUF_ADDR_FIFO2_CONTENT FIFO Content of address buffered in Buffer Address FIFO2, only used in Buffer Addr FIFO Mode.
15:14	/	/	/
13:8	RO	0x0	CSIC_DMA_BUF_ADDR_FIFO1_CONTENT FIFO Content of address buffered in Buffer Address FIFO1, only used in Buffer Addr FIFO Mode.
7:6	/	/	/
5:0	RO	0x0	CSIC_DMA_BUF_ADDR_FIFO0_CONTENT FIFO Content of address buffered in Buffer Address FIFO0, only used in Buffer Addr FIFO Mode.

6.1.8.31 0x0094 CSIC DMA Stored Frame Counter Register (Default Value:0x0000_0000)

Offset: 0x0094			Register Name: CSIC_DMA_STORED_FRM_CNT_REG
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/
7:0	RO	0x0	CSIC_DMA_STORED_FRM_CNT Indicates value of stored frames counter. When the counter value reaches CSIC_DMA_STORED_FRM_THRESHOLD, the counter is cleared to 0. Only used in Buffer Addr FIFO Mode.

6.1.8.32 0x01F4 CSIC DMA Feature List Register(Default Value:0x0000_0000)

Offset: 0x01F4			Register Name: CSIC_FEATURE_REG
Bit	Read/Write	Default/Hex	Description
31:2	/	/	/
1	R	0x0	DMA0_EMBEDDED_LBC 0: No Embedded LBC 1: Embedded LBC
0	R	0x0	DMA0_EMBEDDED_FBC 0: No Embedded DMA 1: Embedded FBC

6.2 TV Decoder

6.2.1 Overview

The Television Decoder (TVD) is an interface that transforms Composite Video Broadcast Signal (CVBS) or component signal into YUV data.

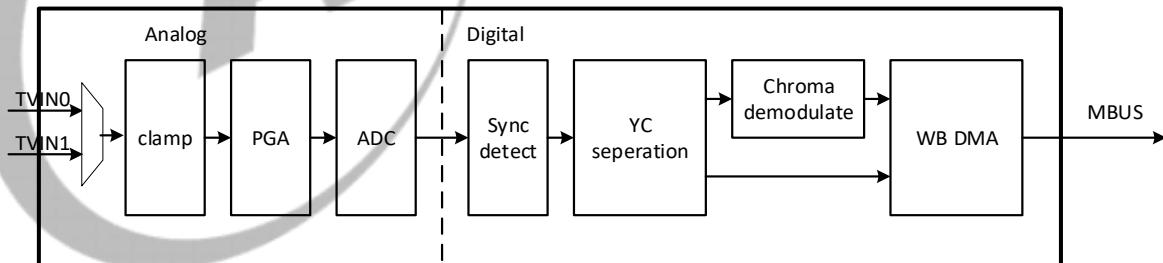

Features:

- 2-channel CVBS input and 1-channel CVBS decoder
- CVBS input, NTSC and PAL supported
- Supports YUV422, YUV420 format
- With 1 channel 3D comb filter
- Detection for signal locked and 625 lines
- Programmable brightness, contrast, saturation
- 10-bit video ADCs

6.2.2 Block Diagram

Figure 6-8 shows a block diagram of the TVD.

7 Memory

7.1 SDRAM Controller (DRAMC)

The DRAMC is embedded with 128 MB DDR3.

The DRAMC has the following features:

- Embedded with 128 MB DDR3
- Supports clock frequency up to 800 MHz

7.2 SD/MMC Host Controller (SMHC)

7.2.1 Overview

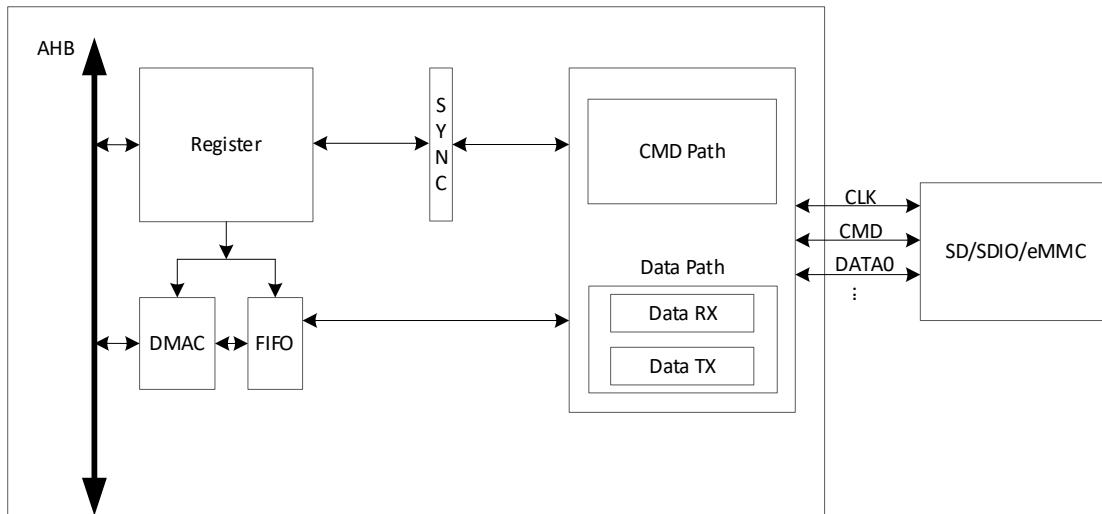

The SMHC controls the read/write operations on the secure digital (SD) cards, multimedia cards (MMC), and various extended devices that is based on the secure digital input/output (SDIO) protocol. The processor provides three SMHC interfaces for controlling the SD cards, MMCs, and SDIO devices.

The SMHC has the following features:

- Supports Command Completion signals and interrupts to host processor, and Command Completion signal disable feature
- The SMHC0 controls the devices that comply with the Secure Digital Memory (SD mem-version 3.0)
- The SMHC1 controls the device that complies with the protocol Secure Digital I/O (SDIO-version 3.0)
- The SMHC2 controls the device that complies with the Multimedia Card (eMMC-version 5.0)
- Maximum performance:
 - SDR mode: 150 MHz@1.8 V IO pad
 - DDR mode: 50 MHz@1.8 V IO pad
 - DDR mode: 50 MHz@3.3 V IO pad
- Supports 1-bit or 4-bit data width
- Hardware CRC generation and error detection
- Programmable baud rate
- Supports SDIO interrupt in 1-bit and 4-bit modes
- Block size of 1 to 65535 bytes
- Descriptor-based internal DMA controller
- Internal 1 KB RXFIFO and 1 KB TXFIFO

7.2.2 Block Diagram

The following figure shows a block diagram of the SMHC.

Figure 7-1 SMHC Block Diagram

SMHC contains the following sub-blocks:

Table 7-1 SMHC Sub-blocks

Sub-block	Description
Register	Used to configure the control signal for reading or writing the SD/SDIO/eMMC.
DMAC	The DMA controller that controls the data transfer between the memory and SMHC.
FIFO	A buffer for the data stream between the memory and the SMHC asynchronous clock domain.
SYNC	Synchronizes the signals from the AHB clock domain to the SMHC clock domain.
CMD Path	Sends commands to or receives commands from the SD/SDIO/eMMC.
Data Path	Consists of Data TX and Data RX sub-modules. The Data TX sends data blocks and the CRC codes to the SD/SDIO/eMMC. The Data RX receives data blocks and the CRC codes from the SD/SDIO/eMMC.

7.2.3 Functional Description

7.2.3.1 External Signals

The following table describes the external signals of SMHC.

Table 7-2 SMHC External Signals

Port Name	Type	Description
SDC0-CMD	I/O, OD	Command Signal for SD Card
SDC0-CLK	O	Clock for SD Card

7.2.3.2 Clock Sources

The SMHC0/1 has 4 different clock sources. The SMHC2 has 5 different clock sources. You can select one of them as the SMHC clock source. The following table describes the clock sources of the SMHC.

For clock setting, configurations, and gating information, refer to section 3.3 “[CCU](#)”.

7.2.3.4 Data Path

The SMHC and SD/SDIO/eMMC contains the following interface buses: CLK, CMD, and DATA 1/4. During one clock cycle, the SMHC can transmit one bit command with one or two bits data in 1-ch DATA mode, or four or eight bits data in 4-ch DATA mode. The CMD is a bidirection channel for initializing the SD/SDIO/eMMC and transmitting commands. It can work in both the open-drain mode and push-pull mode. The DATA is also a bidirection channel. It works in the push-pull mode.

Reading Data from the SD/SDIO/eMMC

The register configures the signals for the read operation, and synchronize the signals to the SMHC clock domain. Then the Data RX reads data from the SD/SDIO/eMMC via the CLK/CMD/DATA interface buses and writes the data in the FIFO. After that, the DMAC transfers the data from the FIFO to the memory.

Writing Data to the SD/SDIO/eMMC

The register configures the signals for the write operation, and synchronize the signals to the SMHC clock domain. Then the DMAC reads data from the memory and writes the data to the FIFO. After that, the Data TX reads the data from the FIFO and writes the data to the SD/SDIO/eMMC via the CLK/CMD/DATA interface buses.

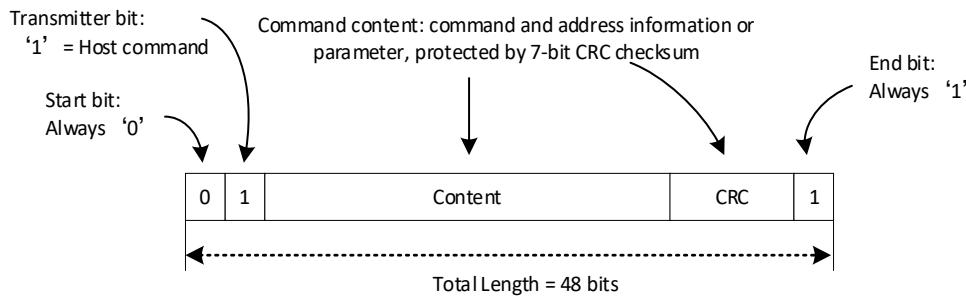

7.2.3.5 Package Format

Data transfer over the SD/eMMC bus is based on command and data bitstreams that are initiated by a start bit and terminated by a stop bit. There are three types of SD/eMMC packets: command token, response token, and data packet.

Command Tokens

The command token starts an operation. A command is sent from the host to a device. It is transferred serially on the CMD line. Command tokens have the following coding scheme:

Figure 7-2 Command Token Format

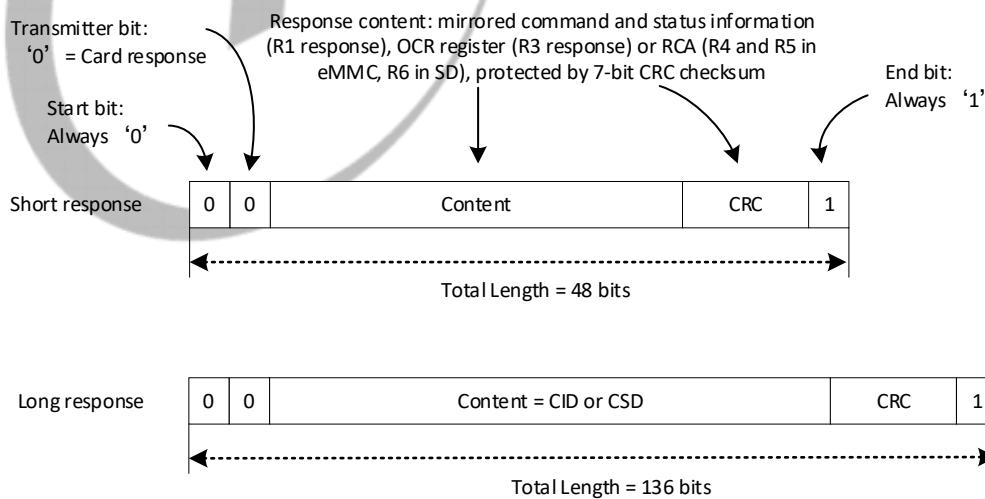

Each command token has 48 bits, preceded by a start bit ('0') and succeeded by an end bit ('1'). To detect transmission errors, each token is protected by CRC bits.

Response Tokens

After receiving a command, the card returns a 48-bit or 136-bit response based on the command type.

A response token is sent from the device to the host as an answer to a previously received command. It is transferred serially on the CMD line.

Figure 7-3 Response Token Format

Data Packets

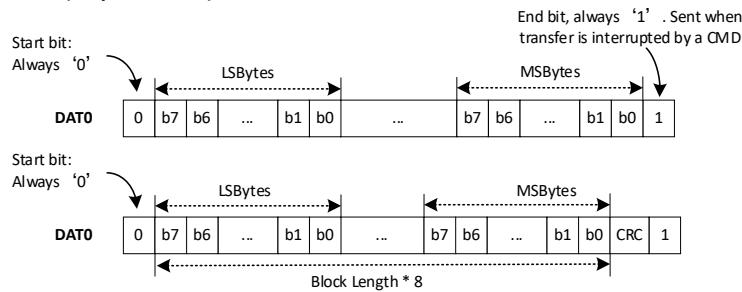

Data can be transferred from the device to the host or vice versa. Data are transferred via the data lines.

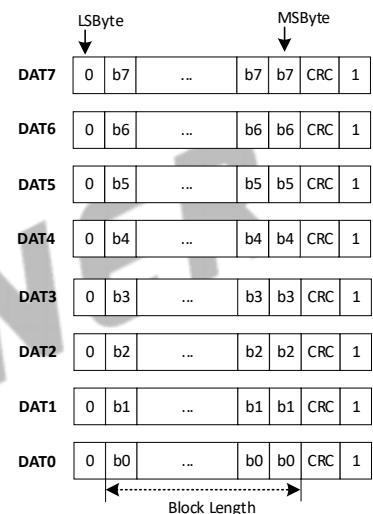

T113-S3 does not support the bus width of 8 bits.

7.2.3.6 Data Transfer

Data transfers to or from the SD/eMMC card are done in blocks. Single and multiple block operations are widely used during data transfer.

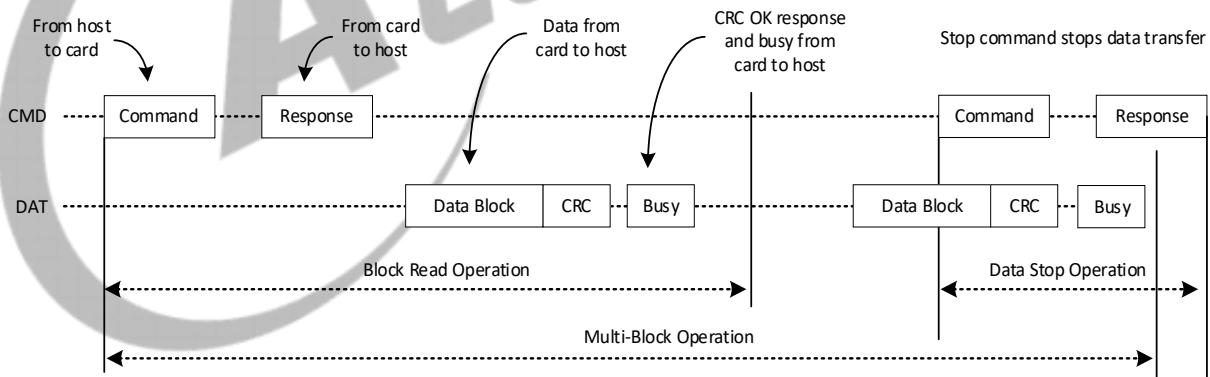

The following figure shows the single-block and multi-block read operation.

7.2.3.8 Phase Offset of the Command and Data

You can configure the phase offset of the command and data by the [SMHC_DRV_DL](#) register.

SDR Mode

The following figure shows the phase offset of SDR command and data.

7.2.3.9 Internal DMA Controller Description

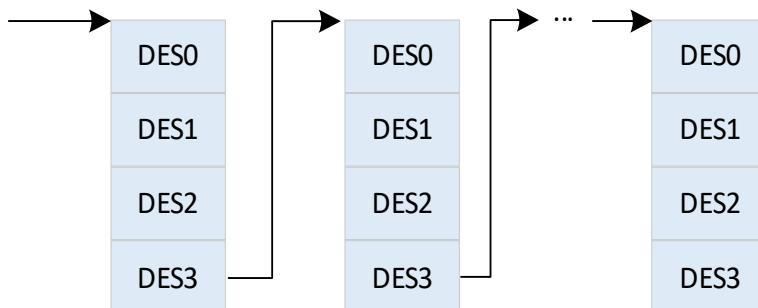

The SMHC has an internal DMA controller (IDMAC) to transfer data between the host memory and SMHC port. With a descriptor, the IDMAC can efficiently move data from the source to destination by automatically loading the next DMA transfer arguments, which needs less CPU intervention. Before transferring data in the IDMAC, the host driver should construct a descriptor list, configure arguments of every DMA transfer, and then launch the descriptor and start the DMA.

The IDMAC has an interrupt controller. When enabled, it generates an interrupt to the HOST CPU in situations such as data transmission is completed or some error is happened.

IDMAC Descriptor Structure

The IDMAC uses a descriptor with a chain structure, and each descriptor points to a unique buffer and the next descriptor.

The following figure shows the internal formats of a descriptor.

Figure 7-13 IDMAC Descriptor Structure Diagram

This figure illustrates the internal formats of a descriptor. The descriptor address must be aligned to the bus width used for 32-bit buses. Each descriptor contains 16 bytes of control and status information.

DES0 corresponds to the [31:0] bits, DES1 corresponds to the [63:32] bits, DES2 corresponds to the [95:64] bits, and DES3 corresponds the [127:96] bits in a descriptor.

The following table shows the bit definition of DES0.

Table 7-9 DES0 Definition

Bits	Name	Description
31	HOLD	DES_OWN_FLAG When set, this bit indicates that the descriptor is owned by the IDMAC. When this bit is reset, it indicates that the descriptor is owned by the host. This bit is cleared when the transfer is over.
30	ERROR	ERR_FLAG When some errors happen in transfer, this bit will be set to 1.
29:5	/	/
4	Chain Flag	CHAIN_MOD When set to 1, this bit indicates that the second address in the descriptor is the next descriptor address. It must be set to 1.
3	First DES Flag	FIRST_FLAG When set to 1, this bit indicates that this descriptor contains the first buffer of data. It must be set to 1 in the first DES.
2	Last DES Flag	LAST_FLAG When set to 1, this bit indicates that the buffers this descriptor points to are the last data buffer.
1	Disable Interrupt on completion	CUR_TXRX_OVER_INT_DIS When set to 1, this bit will prevent the setting of the TX/RX interrupt bit of the IDMAC status register for data that ends in the buffer the descriptor points to.
0	/	/

The following table shows the bit definition of DES1.

Table 7-10 DES1 Definition

Bits	Name	Description
31:13	/	/
12:0	Buffer size	BUFF_SIZE The bits indicate the data buffer byte size, which must be a multiple of 4 bytes. If this field is 0, the DMA ignores this buffer and proceeds to the next descriptor.

The following table shows the bit definition of DES2.

Table 7-11 DES2 Definition

Bits	Name	Descriptor
31:0	Buffer address pointer	BUFF_ADDR The bits indicate the physical address of the data buffer. It is a word address.

The following table shows the bit definition of DES3.

Table 7-12 DES3 Definition

Bits	Name	Descriptor
31:0	Next descriptor address	NEXT_DESP_ADDR The bits indicate the pointer to the physical memory where the next descriptor is present. It is a word address.

7.2.3.10 Calibrating the Delay Chain

There are two delay chains in SMHC: data strobe delay chain and sample delay chain.

Data strobe delay chain: used to generate delay to make proper timing between Data Strobe and data signals.

Sample delay chain: used to generate delay to make proper timing between the internal card clock signal and data signals.

Each delay chain is made up with 64 delay cells. The delay time of one delay cell can be estimated through delay chain calibration.

Follow the steps below to calibrate the delay chain:

- Step 1** Enable SMHC. In order to calibrate the delay chain by the operation registers in SMHC, the SMHC must be enabled through [SMHC Bus Gating Reset Register](#) and [SMHCx Clock Register](#).
- Step 2** Configure a proper clock for SMHC. The delay chain calibration is based on the clock for SMHC from Clock Control Unit (CCU). The delay chain calibration is an internal function in SMHC and needs no devices. So it is unnecessary to open the clock signal for devices. The recommended clock frequency is 200 MHz.
- Step 3** Set proper initial delay value. Writing 0xA0 to **delay control register** enables **Delay Software Enable** (bit[7]) and sets initial delay value 0x20 to **Delay chain** (bit[5:0]). Then write 0x0 to **delay control register** to clear the value.
- Step 4** Write 0x8000 to **delay control register** to start calibrating the delay chain.
- Step 5** Wait until the flag (bit14 in **delay control register**) of calibration done is set. The number of delay cells is shown at bit[13:8] in **delay control register**. The delay time generated by these delay cells is equal to the cycle of the SMHC clock nearly. This value is the result of calibration.
- Step 6** Calculate the delay time of one delay cell according to the cycle of the SMHC clock and the result of calibration.

7.2.4 Programming Guidelines

7.2.4.1 Initializing SMHC

Before data and commands are exchanged between a card and the SMHC, the SMHC needs to be initialized. Follow the steps below to initialize the SMHC:

- Step 1** Configure the corresponding GPIO register as an SMHC by Port Controller module; reset clock by writing 1 to [SMHC_BGR_REG](#)[SMHCx_RST], and open clock gating by writing 1 to [SMHC_BGR_REG](#)[SMHCx_GATING]; select clock sources and set the division factor by configuring the [SMHCx_CLK_REG](#) ($x = 0, 1$) register.
- Step 2** Configure [SMHC_CTRL](#) to reset the FIFO and controller, and enable the global interrupt; configure [SMHC_INTMASK](#) to 0xFFCE to enable normal interrupts and error abnormal interrupts, and then register the interrupt function.
- Step 3** Configure [SMHC_CLKDIV](#) to open clock for devices; configure [SMHC_CMD](#) as the change clock command (for example 0x80202000); send the update clock command to deliver clocks to devices.

Step 4 Configure [SMHC_CMD](#) as a normal command. Configure [SMHC_CMDARG](#) to set command parameters. Configure [SMHC_CMD](#) to set parameters like whether to send the response, the response type, and the response length and then send the commands. According to the initialization process in the protocol, you can finish SMHC initialization by sending the corresponding command one by one.

7.2.4.2 Writing a Single Data Block

To write a single data block, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To write one block data to sector1, configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x200 and configure the descriptor according to the data size; set the data sector address of CMD24 (Single Data Block Write) to 0x1, write 0x80002758 to [SMHC_CMD](#), and send CMD24 command to write data to the device.
- Step 4** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successfully; otherwise, continue to wait until timeout, and then exit the process.
- Step 5** Check whether [SMHC_IDST](#)[TX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_RINTSTS](#)[DTC] is 1. If yes, the data transfer and CMD24 writing operations are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.
- Step 7** Send CMD13 command to query whether the device writing operation is completed and returns to the idle status. For example, device RCA is 0x1234, first set [SMHC_CMDARG](#) to 0x12340000, write 0x8000014D to [SMHC_CMD](#), go to step4 to ensure command transfer completed, and then check whether the highest bit of [SMHC_RESPO](#) (CMD13 response) is 1. If yes, the device is in the idle status, and the next command can be sent. Otherwise, the device is in the busy status. Continue to send CMD13 to wait for the device to enter the idle status until timeout.

7.2.4.3 Reading a Single Data Block

To read a single data block, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To read one block data from sector1, configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x200 and configure the descriptor according to the data size; set the data sector address of CMD17 command (Single Data Block Read) to 0x1, write 0x80002351 to [SMHC_CMD](#), and send CMD17 command to read data from the device to DRAM/SRAM.
- Step 4** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successfully; otherwise, continue to wait until timeout, and then exit the process.
- Step 5** Check whether [SMHC_IDST](#)[RX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_RINTSTS](#)[DTC] is 1. If yes, data transfer and CMD17 reading operation are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.

7.2.4.4 Writing Open-Ended Multiple Data Blocks (CMD25 + Auto CMD12)

To write open-ended multiple data blocks, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To write three blocks of data to sectors begin with sector0, configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x600 and configure the descriptor according to the data size; set the data sector address of CMD25 command (Multiple Data Blocks Write) to 0x0, write 0x80003759 to [SMHC_CMD](#), and send CMD25 command to read data from the device to DRAM/SRAM.
- Step 4** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successfully; otherwise, continue to wait until timeout, and then exit the process.

- Step 5** Check whether [SMHC_IDST](#)[RX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_RINTSTS](#) [ACD] and [SMHC_RINTSTS](#)[DTC] are both 1. If yes, the data transfer, CMD12 transfer, and CMD25 writing operations are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.
- Step 7** Send CMD13 command to query whether the device writing operation is completed and returns to the idle status. For example, device RCA is 0x1234, first set [SMHC_CMDARG](#) to 0x12340000, write 0x80000014D to [SMHC_CMD](#), go to step4 to ensure command transfer completed, and then check whether the highest bit of [SMHC_RESP0](#) (CMD13 response) is 1. If yes, the device is in the idle status, and the next command can be sent. Otherwise, the device is in the busy status. Continue to send CMD13 to wait for the device to enter the idle status until timeout.

7.2.4.5 Reading Open-Ended Multiple Data Blocks (CMD18 + Auto CMD12)

To read open-ended multiple data blocks, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To read three blocks of data from sectors begin with sector0, configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x600 and configure the descriptor according to the data size; set the data sector address of CMD18 command (Multiple Data Blocks Read) to 0x0, write 0x80003352 to [SMHC_CMD](#), and send CMD18 command to read data to the device. When the data transfer is completed, CMD12 will be sent automatically.
- Step 4** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successfully; otherwise, continue to wait until timeout, and then exit the process.
- Step 5** Check whether [SMHC_IDST](#)[RX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_RINTSTS](#) [ACD] and [SMHC_RINTSTS](#)[DTC] are both 1. If yes, data transfer, CMD12 transfer, and CMD18 reading operation are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.

7.2.4.6 Writing Pre-Defined Multiple Data Blocks (CMD23 + CMD25)

To write pre-defined multiple data blocks, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure SMHC_DLBA to determine the start address of the DMA descriptor.
- Step 3** To write three blocks of data, configure [SMHC_CMDARG](#) to 0x3 to specify the number of data blocks as three. Then write 0x80000157 to [SMHC_CMD](#) to send the CMD23 command. Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successful; otherwise, continue to wait until timeout, and then exit the process.
- Step 4** Configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x600 and configure the descriptor according to the data size; set the data sector address of CMD25 command (Multiple Data Blocks Write) to 0x0, write 0x80002759 to [SMHC_CMD](#), and send CMD25 command to write data to the device.
- Step 5** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successful; otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_IDST](#)[TX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 7** Check whether [SMHC_RINTSTS](#)[DTC] is 1. If yes, the data transfer and CMD25 writing operations are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.
- Step 8** Send CMD13 command to query whether the device writing operation is completed and returns to the idle status. For example, device RCA is 0x1234, first set [SMHC_CMDARG](#) to 0x12340000, write 0x8000014D to [SMHC_CMD](#), go to step4 to ensure command transfer completed, and then check whether the highest bit of [SMHC_RESPO](#) (CMD13 response) is 1. If yes, the device is in the idle status, and the next command can be sent. Otherwise, the device is in the busy status. Continue to send CMD13 to wait for the device to enter the idle status until timeout.

7.2.4.7 Reading Pre-Defined Multiple Data Blocks (CMD23 + CMD18)

To read pre-defined multiple data blocks, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To read three blocks of data, configure [SMHC_CMDARG](#) to 0x3 to specify the number of data blocks as three. Then write 0x80000157 to [SMHC_CMD](#) to send the CMD23 command. Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successful; otherwise, continue to wait until timeout, and then exit the process.
- Step 4** Configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x600 and configure the descriptor according to the data size; set the data sector address of CMD18 (Multiple Data Blocks Read) to 0x0, write 0x80002352 to [SMHC_CMD](#), and send CMD18 command to read data from device to DRAM/SRAM.
- Step 5** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successful; otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_IDST](#)[TX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 7** Check whether [SMHC_RINTSTS](#)[DTC] is 1. If yes, the data transfer and CMD18 writing operations are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.

7.2.6 Register Description

7.2.6.1 0x0000 SMHC Global Control Register (Default Value: 0x0000_0100)

Offset: 0x0000			Register Name: SMHC_CTRL
Bit	Read/Write	Default/Hex	Description
31	R/W	0x0	FIFO_AC_MOD FIFO Access Mode 0: DMA bus 1: AHB bus
30:13	/	/	/
12	R/W	0x0	TIME_UNIT_CMD Time unit for command line The time unit is used to calculate the command line time out value defined in RTO_LMT. 0: 1 card clock period 1: 256 card clock period
11	R/W	0x0	TIME_UNIT_DAT Time unit for data line Time unit is used to calculate the data line time out value defined in DTO_LMT. 0: 1 card clock period 1: 256 card clock period
10	R/W	0x0	DDR_MOD_SEL DDR Mode Select Although the HS400 speed mode of eMMC is 8-bit DDR, this field should be cleared when HS400_MD_EN is set. 0: SDR mode 1: DDR mode
9	/	/	/

Offset: 0x0000			Register Name: SMHC_CTRL
Bit	Read/Write	Default/Hex	Description
8	R/W	0x1	<p>CD_DBC_ENB Card Detect (Data[3] status) De-bounce Enable 0: Disable de-bounce 1: Enable de-bounce</p>
7:6	/	/	/
5	R/W	0x0	<p>DMA_ENB DMA Global Enable 0: Disable DMA to transfer data via AHB bus 1: Enable DMA to transfer data</p>
4	R/W	0x0	<p>INT_ENB Global Interrupt Enable 0: Disable interrupts 1: Enable interrupts</p>
3	/	/	/
2	R/W	0x0	<p>DMA_RST DMA Reset</p>
1	R/W	0x0	<p>FIFO_RST FIFO Reset 0: No effect 1: Reset the FIFO This bit is auto-cleared after the completion of the reset operation.</p>
0	R/W	0x0	<p>SOFT_RST Software Reset 0: No effect 1: Reset SD/MMC controller This bit is auto-cleared after the completion of reset operation.</p>

7.2.6.2 0x0004 SMHC Clock Control Register (Default Value: 0x0000_0000)

Offset: 0x0004			Register Name: SMHC_CLKDIV
Bit	Read/Write	Default/Hex	Description
31	R/W	0x0	<p>MASK_DATA0 0: Do not mask data0 when update clock 1: Mask data0 when update clock</p>
30:18	/	/	/

Offset: 0x0004			Register Name: SMHC_CLKDIV
Bit	Read/Write	Default/Hex	Description
17	R/W	0x0	CCLK_CTRL Card Clock Output Control 0: Card clock is always on. 1: Turn off card clock when FSM is in IDLE state.
16	R/W	0x0	CCLK_ENB Card Clock Enable 0: Card Clock is off. 1: Card Clock is on.
15:8	/	/	/
7:0	R/W	0x0	CCLK_DIV Card Clock Divider n: Source clock is divided by 2*n. (n = 0 to 255) When HS400_MD_EN is set, this field must be cleared.

7.2.6.3 0x0008 SMHC Timeout Register (Default Value: 0xFFFF_FF40)

Offset: 0x0008			Register Name: SMHC_TMOUT
Bit	Read/Write	Default/Hex	Description
31:8	R/W	0xffffffff	DTO_LMT Data Timeout Limit This field can set the time that the host waits for the data from the device. Ensure to communicate with the device, this field must be set to the maximum that is greater than the time N_{AC} . About the N_{AC} , the explanation is as follows: When Host read data, data transmission from the Device starts after the access time delay N_{AC} beginning from the end bit of the read command (ACMD51, CMD8, CMD17, and CMD18). When the host reads multiple block (CMD18), a next block's data transmission from the Device starts after the access time delay N_{AC} beginning from the end bit of the previous block. When the host writes data, the value is no effect.
7:0	R/W	0x40	RTO_LMT Response Timeout Limit

7.2.6.4 0x000C SMHC Bus Width Register (Default Value: 0x0000_0000)

Offset: 0x000C			Register Name: SMHC_CTYPE
Bit	Read/Write	Default/Hex	Description
31:2	/	/	/
1:0	R/W	0x0	CARD_WID Card Width 00: 1-bit width 01: 4-bit width 1x: 8-bit width

7.2.6.5 0x0010 SMHC Block Size Register (Default Value: 0x0000_0200)

Offset: 0x0010			Register Name: SMHC_BLKSIZ
Bit	Read/Write	Default/Hex	Description
31:16	/	/	/
15:0	R/W	0x200	BLK_SZ Block Size

7.2.6.6 0x0014 SMHC Byte Count Register (Default Value: 0x0000_0200)

Offset: 0x0014			Register Name: SMHC_BYTCNT
Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x200	BYTE_CNT Byte counter The number of bytes to be transferred. It must be integer multiple of Block Size (BLK_SZ) for block transfers.

7.2.6.7 0x0018 SMHC Command Register (Default Value: 0x0000_0000)

Offset: 0x0018			Register Name: SMHC_CMD
Bit	Read/Write	Default/Hex	Description
31	R/W	0x0	CMD_LOAD Start Command This bit is automatically cleared when the current command is sent. If there is no response error happens, a command complete interrupt bit (CMD_OVER) will be set in the interrupt register. Do not write any other commands until this bit is cleared.
30:29	/	/	/
28	R/W	0x0	VOL_SW Voltage Switch 0: Normal command 1: Voltage switch command, set for CMD11 only.
27	R/W	0x0	BOOT_ABТ Boot Abort Setting this bit will terminate the boot operation.
26	R/W	0x0	EXP_BOOT_ACK Expect Boot Acknowledge When the software sets this bit along in mandatory boot operation, the controller expects a boot acknowledge start pattern of 0-1-0 from the selected card.
25:24	R/W	0x0	BOOT_MOD Boot Mode 00: Normal command 01: Mandatory Boot operation 10: Alternate Boot operation 11: Reserved
23:22	/	/	/
21	R/W	0x0	PRG_CLK Change Clock 0: Normal command 1: Change Card Clock When this bit is set, the controller will change the clock domain and clock output. No commands will be sent.
20:16	/	/	/

Offset: 0x0018			Register Name: SMHC_CMD
Bit	Read/Write	Default/Hex	Description
15	R/W	0x0	SEND_INIT_SEQ Send Initialization 0: Normal command sending 1: Send initialization sequence before sending this command.
14	R/W	0x0	STOP_ABТ_CMD Stop Abort Command 0: Normal command sending 1: Send <i>Stop</i> or <i>Abort</i> command to stop the current data transfer in progress. (CMD12, CMD52 for writing “I/O Abort” in SDIO CCCR)
13	R/W	0x0	WAIT_PRE_OVER Wait for Data Transfer Over 0: Send command at once, does not care about data transferring. 1: Wait for data transfer completion before sending the current command.
12	R/W	0x0	STOP_CMD_FLAG Send Stop CMD Automatically (CMD12) 0: Do not send stop command at the end of the data transfer. 1: Send stop command automatically at the end of the data transfer. If set, the SMHC_RESP1 will record the response of auto CMD12.
11	R/W	0x0	TRANS_MODE Transfer Mode 0: Block data transfer command 1: Stream data transfer command
10	R/W	0x0	TRANS_DIR Transfer Direction 0: Read operation 1: Write operation
9	R/W	0x0	DATA_TRANS Data Transfer 0: Without data transfer 1: With data transfer

8.1 I2S/PCM

8.1.1 Overview

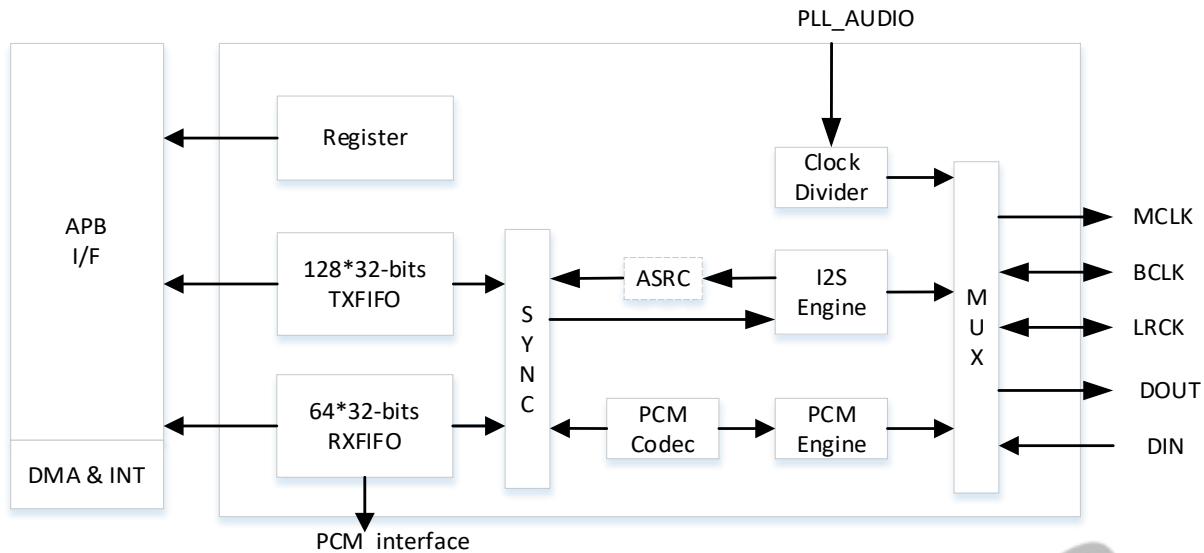

The I2S/PCM controller is designed to transfer streaming audio-data between the system memory and the codec chip. The controller supports standard I2S format, Left-justified mode format, Right-justified mode format, PCM mode format, and TDM mode format.

The I2S/PCM controller includes the following features:

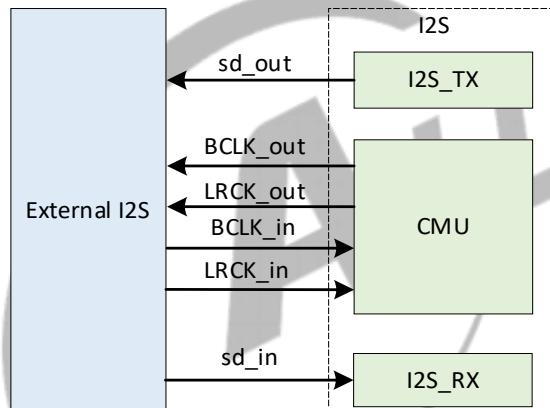

- Two I2S/PCM external interfaces (I2S1, I2S2) for connecting external power amplifier and MIC ADC
- Compliant with standard Philips Inter-IC sound (I2S) bus specification
 - Left-justified, Right-justified, PCM mode, and Time Division Multiplexing (TDM) format
 - Programmable PCM frame width: 1 BCLK width (short frame) and 2 BCLKs width (long frame)
- Transmit and Receive data FIFOs
 - Programmable FIFO thresholds
 - 128 depth x 32-bit width TXFIFO and 64 depth x 32-bit width RXFIFO
- Supports multiple function clock
 - Clock up to 24.576 MHz Data Output of I2S/PCM in Master mode (Only if the IO PAD and Peripheral I2S/PCM satisfy Timing Parameters)
 - Clock up to 12.288 MHz Data Input of I2S/PCM in Master mode
- Supports TX/RX DMA Slave interface
- Supports multiple application scenarios
 - Up to 16 channels ($f_s = 48 \text{ kHz}$) which has adjustable width from 8-bit to 32-bit
 - Sample rate from 8 kHz to 384 kHz (CHAN = 2)
 - 8-bit u-law and 8-bit A-law companded sample
- Supports master/slave mode

8.1.2 Block Diagram

The following figure shows the functional block diagram of the I2S/PCM interface.

Figure 8-1 I2S/PCM Interface System Block Diagram

The following figure shows the typical application of the I2S/PCM interface.

Figure 8-2 Typical Application of I2S/PCM Interface

The I2S/PCM interface system integrates one I2S_TX and one I2S_RX.

- The I2S_TX is for playing music in I2S or PCM format.
- The I2S_RX is for receiving data in I2S or PCM format.
- When the I2S works in the master mode, the external I2S module provides BCLK_in and LRCK_in for the clock management unit (CMU), and the I2S_TX and I2S_RX work with the two external clocks.
- When the I2S works in the slave mode, the CMU provides clocks BCLK_out and LRCK_out for the external I2S module, and the I2S_TX and I2S_RX work with the internal clocks.

8.1.3 Functional Description

8.1.3.1 External Signals

The following table describes the external signals of the I2S/PCM interface.

LRCK and BCLK are bidirectional I/O. When the I2S/PCM interface works in the Master mode, LRCK and BCLK are output pins. When the I2S/PCM interface works in the Slave mode, LRCK and BCLK are input pins.

MCLK is an output pin for external devices. DOUT are the serial data output pins and DIN are the serial data input pins. For details about General Purpose I/O port, refer to section 9.7 “[GPIO](#)”.

Table 8-1 I2S/PCM External Signals

Signal Name	Description	Type

8.1.3.2 Clock Sources

The following table describes the clock sources for I2S/PCM. For clock setting, configurations, and gating information, refer to section 3.3 “[CCU](#)”.

Table 8-2 I2S/PCM Clock Sources

Clock Name	Description
PLL_AUDIO0(1X)	By default, PLL_AUDIO0(1X) is 24.5714 MHz, and PLL_AUDIO0(4X) is 98.2856 MHz.
PLL_AUDIO1(DIV2)	By default, PLL_AUDIO1 is 3072 MHz, PLL_AUDIO1(DIV2) is 1536 MHz, and PLL_AUDIO1(DIV5) is 614.4 MHz (24.576 MHz*25).

8.1.3.3 Timing Diagram

The I2S/PCM supports standard I2S mode, Left-justified I2S mode, Right-justified I2S mode, PCM mode, and TDM mode. The software can select the modes by setting [I2S/PCM CTL](#). The following figures describe the waveforms for SYNC, BCLK, DOUT, and DIN in different modes.

Each sampling period contains an LRCK. The low level of LRCK is the left channel corresponding to the even slots, and the high level is the right channel corresponding to the odd slots. Each slot is the sampling point of a mono channel. The sampling period can support the transmission of 2/4/8/16 slots. The BCLK corresponds to the serial data bit.

8.1.3.4 DIN Slot Mapping

The 4-wire DIN has 64 slots, each wire DIN has 16 slots. However, only 16 slots are valid and act as the RX channels.

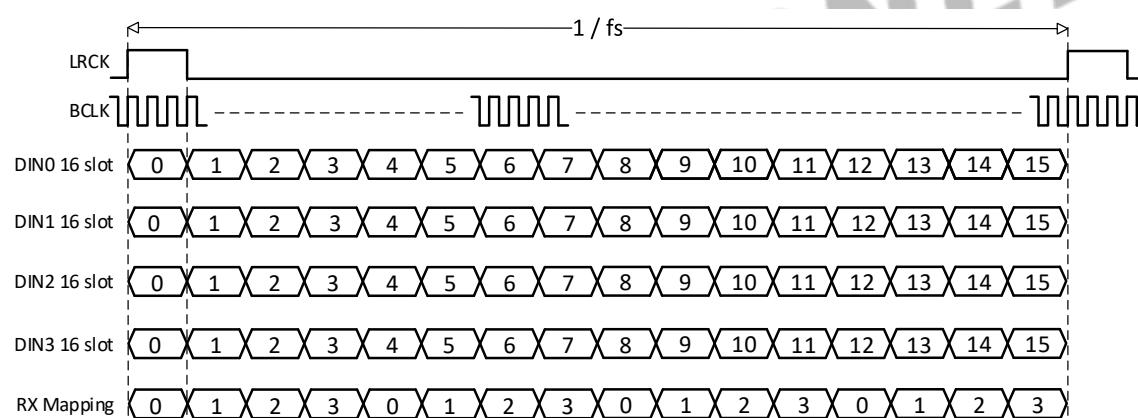

The following table shows the relationship between the slot id and encoder.

Table 8-3 DIN Slot ID and Encoder

DIN0 Slot ID	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
DIN1 Slot ID	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
DIN2 Slot ID	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
DIN3 Slot ID	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

There are 16 channels mapping configuration, each wire selects four slots for RX. The following figure shows the 16-channel mapping configuration.

Figure 8-8 16-Channel Mapping Configuration

8.1.3.5 ASRC

The ASRC module supports sampling rate conversion between the up-sampling and down-sampling. The ASRC also supports sampling rate conversion between dual-channel audio data, and the size of the sampling data is up to 24 bits.

The ASRC module has the following features:

- Typical THD + N: -130 dB (Range: -125 dB to -139 dB)
- Supports sampling rate conversion between the up-sampling and down-sampling to implement the sampling rate conversion for stereo data
 - The up-sampling ratio ranges from 1 to 7.5x

- The down-sampling ratio ranges from 8 to 1x
- Supports sampling rate conversion between two identical frequencies
- Sampling rate for both the input and output range is from 8 kHz to 192 kHz and can be decimal
- Sampling rate can be configured manually or via adaptive generation
- The ASRC input is connected to I2S RX_FIFO_WDATA [31:8], and the input data is 24-bit MSB big-endian. For the input data that is less than 24 bits, use zeros to pad out the values at the low bits instead of high bits
- The ASRC needs some time to calculate the result. The output outsamplea/b will keep 0 during the calculation, and then change to the valid value when the result comes out

Calculating the ASRC Latency

Calculate the ASRC up-sampling and down-sampling latency according to the following formulas.

$$\text{Upsampling Latency} = \text{Phase Delay} + \text{FIFO Delay} = 32 + 16 = 48 \text{ Input Sample Periods}$$

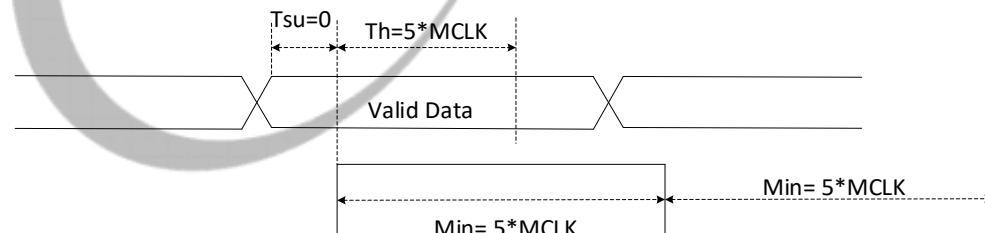

$$\text{Downsampling Latency} = \text{Phase Delay} + \text{FIFO Delay} = (32 * f_{\text{out}} / f_{\text{in}}) + 16 \text{ Input Sample Periods}$$

ASRC Timing

The MCLK samples the input clock CLKIN to generate pulse signals.

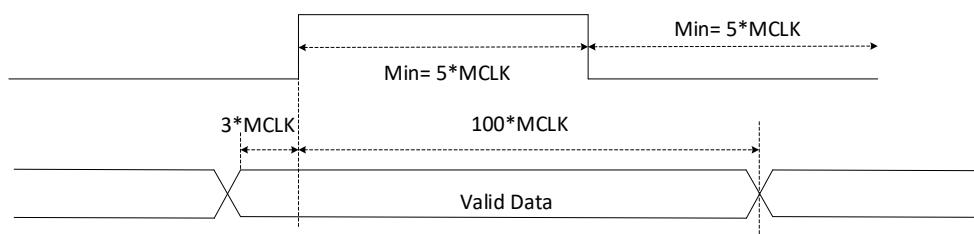

The following figure shows the timing requirements for the inputs.

Figure 8-9 Timing Requirements for Inputs

The following figure shows the timing requirements for the outputs.

Figure 8-10 Timing Requirements for Outputs

For the up-sampling, $F_{MCLK} = F_{sout} * 1350$.

For the down-sampling, $F_{MCLK} = F_{sin} * 0.30 + F_{sout} * 295$.

The following table provides the proper values of MCLK in MHz with different F_{sin} and F_{sout} in kHz.

Table 8-4 Proper MCLK Values with Different F_{sin} and F_{sout}

F_{sout} F_{sin}	32	44.1	48	88.2	96	144	192
32	45	60	65	120	130	195	260
44.1	55	60	65	120	130	195	260
48	60	65	65	120	130	195	260
88.2	105	105	110	120	130	195	260
96	110	115	115	125	130	195	260
144	160	165	165	175	180	195	260
192	210	215	215	225	230	245	260

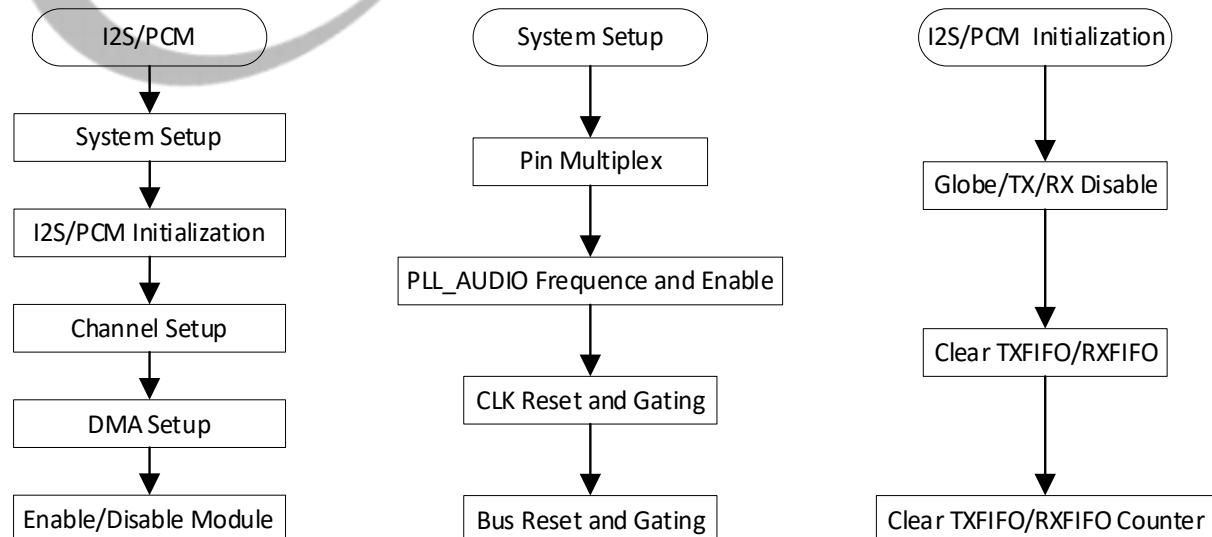

Note: The units for F_{sin} and F_{sout} are kHz and MCLK is MHz.

8.1.3.6 Operation Modes

The software operation of the I2S/PCM is divided into five steps: system setup, I2S/PCM initialization, the channel setup, DMA setup, and Enable/Disable module.

The following figure shows the whole operation flow of I2S/PCM.

Figure 8-11 I2S/PCM Operation Flow

1. System Setup and I2S/PCM Initialization

The clock source for the I2S/PCM should be followed. Firstly, disable the PLL_AUDIO through [PLL_AUDIOx Control Register](#)[PLL_ENABLE] in the CCU. Secondly, set up the frequency of the PLL_AUDIO in the [PLL_AUDIOx Control Register](#). After that, enable the I2S/PCM gating through the [I2S/PCMx CLK REG](#) when you checkout that the [PLL_AUDIOx Control Register](#)[LOCK] becomes to 1. At last, reset and enable the I2S/PCM bus gating by setting [I2S/PCM_BGR_REG](#).

After the system setup, the register of I2S/PCM can be setup. Firstly, initialize the I2S/PCM. You should close the Globe Enable bit ([I2S/PCM_CTL](#)[0]), Transmitter Block Enable bit ([I2S/PCM_CTL](#)[2]), and Receiver Block Enable bit ([I2S/PCM_CTL](#)[1]) by writing 0. After that, clear the TX/RX FIFO by writing 0 to the bit[25:24] of [I2S/PCM_FCTL](#). At last, you can clear the TX FIFO and RX FIFO counter by writing 0 to [I2S/PCM_TXCNT](#) and [I2S/PCM_RXCNT](#).

2. Channel Setup and DMA Setup

First, you can set up the I2S/PCM of master and slave. The configuration can be referred to the protocol of I2S/PCM. Then, you can set up the translation mode, the sample resolution, the wide of the slot, the channel slot number, and the trigger level, and so on. The setup of the register can be found in the specification.

The I2S/PCM supports two methods to transfer the data. The most common way is DMA, the setup of DMA can be found in the “[DMA](#)”. In this module, you just enable the DRQ.

3. Enable and Disable I2S/PCM

To enable the function, you can enable TX/RX by writing [I2S/PCM_CTL](#)[TXEN]/[I2S/PCM_CTL](#)[RXEN]. After that, enable I2S/PCM by writing 1 to [I2S/PCM_CTL](#)[Globe Enable]. Write 0 to the Globe Enable bit to disable I2S/PCM.

8.1.4 Programming Guidelines

8.1.4.1 Application Example of Processing ASRC Input and Output Data

The following example shows a typical application of ASRC: the input data is 24-bit valid, and the output data is a 32-bit data whose highest 24 bits are valid output and the lowest eight bits are padded out with zeros.

To implement the application, configure the sample resolution and slot width as 32 bits. Follow the steps below:

Step 1 For the input register: 0x04 [6:4] sample_res = 3'h7, 0x04 [2:0] slot_width = 3'h7.

The format of the input data: 32'hXXXXXXXX, where, bit[31] is the MSB and X is the valid data bit.

Step 2 For the output register: 0x04 [6:4] sample_res = 3'h7, 0x04 [2:0] slot_width = 3'h7

The format of the output data: 32'hXXXXXX00, where, bit[31] is the MSB, X is the valid data bit, and bit[7:0] are the padded zeros.

8.1.4.2 Converting the Sampling Rate with ASRC

Converting a 48 kHz sampling rate to 16 kHz is the most common scenario in actual applications. Follow the steps below to convert the sampling rate from 48 kHz to 16 kHz for the 32-bit data.

1. Configure the PLL_AUDIO Register

- a) Configure the [PLL_AUDIO0_CTRL_REG](#)[31:0] as 0x8814AB01. That is, $\text{PLL_AUDIO0} = 24 * (171+1)/(1+1)/(1+0)/(1+20) = 98.286 \text{ MHz}$. According to the relationship among the Fsin, Fsout, and MCLK, the MCLK should be greater than 60 MHz. In the simulation phase, the HOSC frequency is 25 MHz, so the output frequency of PLL_AUDIO0 should be $25 * (171+1)/(1+1)/(1+0)/(1+20) = 102.381 \text{ MHz}$. In the IC test phase, configure the frequency of PLL_AUDIO0 according to its actual output frequency.
- b) It is suggested that you configure the ASRC MCLK as an equal-duty-cycle signal. You can specify an odd number for bit[21:16] (PLL_POST_DIV_P) of [PLL_AUDIO0_CTRL_REG](#) to get an equal-duty-cycle output clock of PLL_AUDIO0.
- c) Configure bit[25:24] of [I2S/PCM2_ASRC_CLK_REG](#) as 0x00 to select the PLL_AUDIO0(4X).

2. Configure the I2S Registers

- a) Configure bit[7:4] (BCLKDIV) of [I2S/PCM_CLKD](#) as 4'h9, that is, the frequency of BCLK will be $98.286 \text{ MHz}/32 = 3.072 \text{ MHz}$.
- b) Configure bit[17:8] (LRCK_PERIOD) of [I2S/PCM_FMT0](#) as 10'h1F. That is, the LRCK_PERIOD width is configured as 32 BLCKs and can generate the ASRC CLKIN with a 48 kHz sampling rate.
$$\left(\frac{3.072\text{MHz}}{32*2}\right) = 48\text{kHz}$$
- c) Configure bit[6:4] (Sample Resolution bits) of [I2S/PCM_FMT0](#) as 3'h7 to specify the sample resolution as 32-bit.
- d) Configure bit[2:0] (Slot Width bits) of [I2S/PCM_FMT0](#) as 3'h7 to specify the slot width as 32-bit.

3. Configure the ASRC Registers

- a) Configure bit[16] (clock gate) of [MCLKCFG](#) as 1'h1 to open the clock gating.
- b) Configure bit[3:0] (division factor) of [MCLKCFG](#) as 1'h1 to specify the division factor as 1.
- c) Configure bit[20] (clock gate) of [FSOUTCFG](#) as 1'h1 to open the clock gating.

- d) Configure bit[19:16] (clock select) of [FsoutCFG](#) as 4`h0 to select I2S0_ASRC_CLK as the clock source.
- e) Configure bit[7:4] (the first division factor) of [FsoutCFG](#) as 16`h13 to configure the first division factor as 128.
- f) Configure bit[3:0] (the second division factor) of [FsoutCFG](#) as 16`h10 to configure the second division factor as 48.
- g) Configure the ASRC ratio.

To configure the ASRC ratio manually, configure bit[31] ([Manual Configuration of ASRC Ratio Enable](#)) of ASRCMANCFG as 1`h1 to enable the manual configuration of ASRC ratio. Configure bit[25:0] of ASRCMANCFG as 26`h155555 to specify the ratio value as 0x155555. The calculation formula for the ratio value: Dec2Hex (Fsout/Fsin)*2²²). In this example, Fsout/Fsin = 16 kHz/48 kHz =1/3, then the ratio is 0x155555.

To configure the ASRC ratio automatically, configure bit[31] ([Manual Configuration of ASRC Ratio Enable](#)) of ASRCMANCFG as 1`h0 to enable the automatic configuration of ASRC ratio. Then the system will automatically calculate the ratio value based on the MCLK, Fsout, and Fsin.

30	R/W	0x0	LRCK_WIDTH LRCK Width (only applies to the PCM mode) 0: LRCK = 1 BCLK Width (Short Frame) 1: LRCK = 2 BCLK Width (Long Frame)
29:20	/	/	/
19	R/W	0x0	LRCK_POLARITY In I2S/Left-Justified/Right-Justified mode: 0: Left Channel when LRCK is low. 1: Left channel when LRCK is high. In PCM mode: 0: PCM LRCK asserted at the negative edge. 1: PCM LRCK asserted at the positive edge.
18	/	/	/
17:8	R/W	0x0	LRCK_PERIOD It is used to program the number of BCLKs per channel of the sample frame. This value is interpreted as follows. PCM mode: Number of BCLKs within (Left + Right) channel width. I2S/Left-Justified/Right-Justified mode: Number of BCLKs within each channel width (Left or Right). For example: N = 7: 8 BCLKs width ... N = 1023: 1024 BCLKs width
7	R/W	0x0	BCLK_POLARITY 0: Normal mode, DOUT drives data at negative edge 1: Invert mode, DOUT drives data at positive edge

8.2 DMIC

8.2.1 Overview

The DMIC controller supports one 8-channel digital microphone interface and can output 128 fs or 64 fs (fs = ADC sample rate).

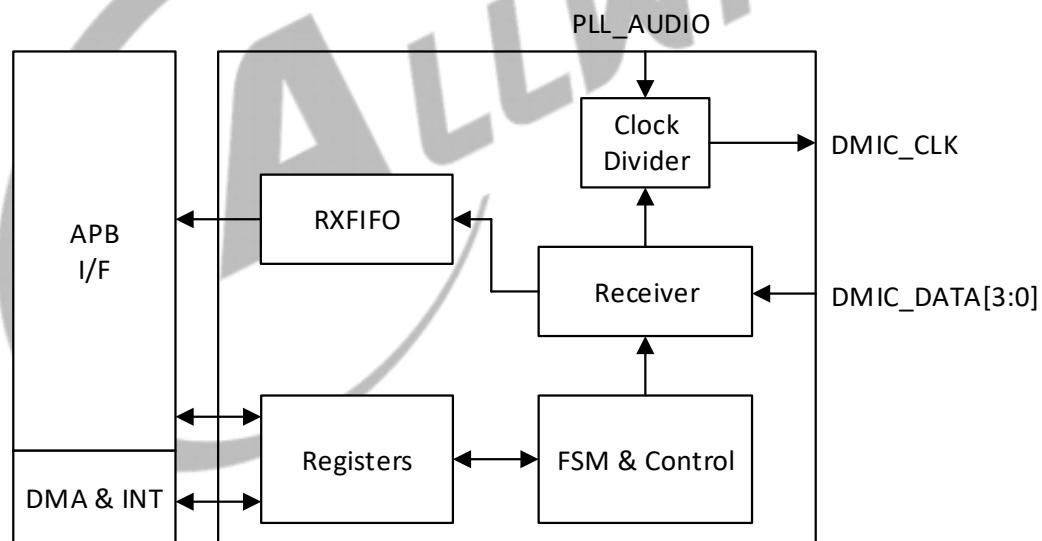

The DMIC controller includes the following features:

- Supports up to 8 channels
- Sample rate from 8 kHz to 48 kHz

8.2.2 Block Diagram

The following figure shows a block diagram of the DMIC.

Figure 8-12 DMIC Block Diagram

8.2.3 Functional Description

8.2.3.1 External Signals

The following table describes the external signals of DMIC.

Table 8-5 DMIC External Signals

Signal	Description	Type
DMIC-CLK	Digital Microphone Clock Output	O
DMIC-DATA0	Digital Microphone Data Input	I
DMIC-DATA1	Digital Microphone Data Input	I
DMIC-DATA2	Digital Microphone Data Input	I
DMIC-DATA3	Digital Microphone Data Input	I

8.2.3.2 Clock Sources

The following table describes the clock source for DMIC. For clock setting, configurations, and gating information, refer to section 3.3 “[CCU](#)”.

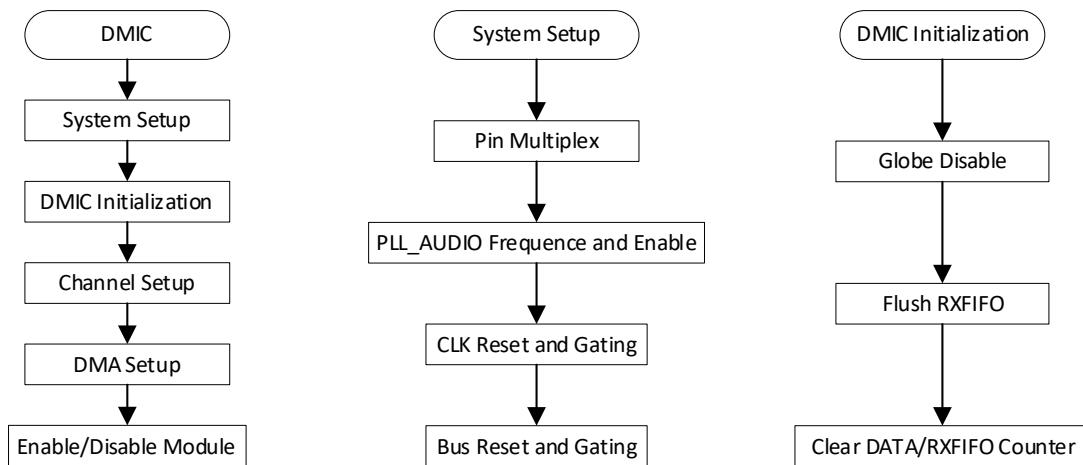

Table 8-6 DMIC Clock Sources

Clock Sources	Description
PLL_AUDIO0(1X)	By default, PLL_AUDIO0(1X) is 24.5714 MHz.
PLL_AUDIO1(DIV2)	By default, PLL_AUDIO1 is 3072 MHz, PLL_AUDIO1(DIV2) is 1536 MHz, and
PLL_AUDIO1(DIV5)	PLL_AUDIO1(DIV5) is 614.4 MHz (24.576 MHz*25).

8.2.3.3 Operation Mode

The software operation of the DMIC is divided into five steps: system setup, DMIC initialization, channel setup, DMA setup, and Enable/Disable module.

The following figure shows the flow chart of the whole operation, the system setup, and the DMIC initialization.

Figure 8-13 DMIC Operation Mode

1. System Setup and DMIC Initialization

The first step in the system setup is properly programming the GPIO because the DMIC port is a multiplex pin. For functions of the multiplex pins, refer to the pin multiplex specification.

Perform the following steps for the clock source. Firstly, disable the PLL_AUDIO through [PLL_AUDIOx Control Register](#)[PLL_ENABLE]. Secondly, set up the frequency of the PLL_AUDIO in [PLL_AUDIOx Control Register](#). Then enable PLL_AUDIO. After that, enable the DMIC gating through [DMIC_CLK_REG](#) when you checkout that the LOCK bit of [PLL_AUDIOx Control Register](#) becomes 1. At last, reset and enable the DMIC bus gating by [DMIC_BGR_REG](#).

After the system setup, the register of DMIC can be setup. Firstly, initialize the DMIC. You should close the globe enable bit ([DMIC_EN](#)[8]), data channel enable bit ([DMIC_EN](#)[7:0]) by writing 0 to it. After that, flush the RXFIFO by writing 1 to [DMIC_RXFIFO_CTR](#)[31]. At last, you can clear the Data/RXFIFO counter by writing 1 to [DMIC_RXFIFO_STA](#), [DMIC_CNT](#).

2. Channel Setup and DMA Setup

You can set up the sample rate, the sample resolution, the over-sample rate, the channel number, the RXFIFO output mode, the RXFIFO trigger level, and so on. The setup of the register can be found in the specification.

The DMIC supports two methods to transfer the data. The most common way is DMA, the setup of DMA can be found in section 3.9 “[DMAC](#)”. In this module, you just enable the DRQ.

3. Enable and Disable DMIC

To enable the function, you can enable the data channel enable bit ([DMIC_EN](#)[7:0]) by writing 1 to it. After that, enable DMIC by writing 1 to the Globe Enable bit ([DMIC_EN](#)[8]). Write 0 to [DMIC_EN](#)[8] to disable DMIC.

8.3 OWA

8.3.1 Overview

The One Wire Audio (OWA) provides a serial bus interface for audio data. This interface is widely used for consumer audio.

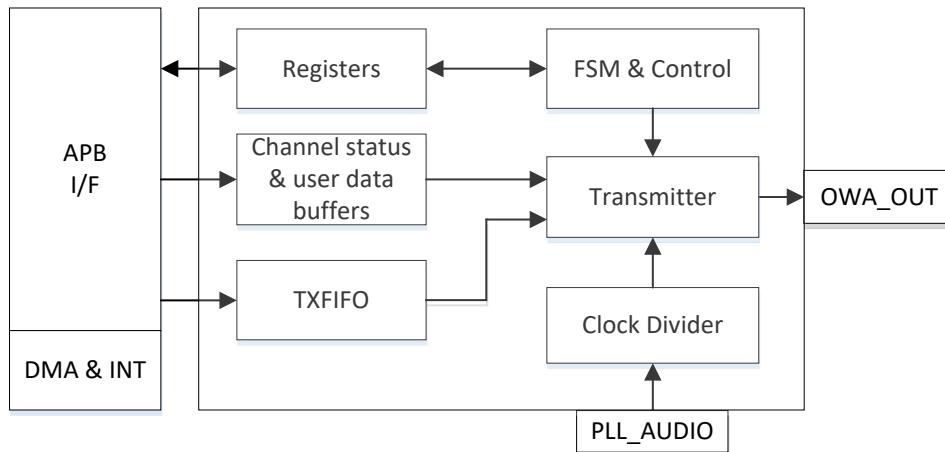

The OWA includes the following features:

- One OWA TX
- Compliance with S/PDIF interface
- IEC-60958 transmitter functionality
- Supports 16-bit, 20-bit, and 24-bit data formats
- One 128×24bits TXFIFO for audio data transfer
- Programmable FIFO thresholds
- Supports TX DMA slave interface
- Function clock includes 24.576 MHz and 22.579 MHz frequency
- Hardware parity generation on the transmitter
- Supports channel status insertion for the transmitter
- Supports interrupts and DMA

8.3.2 Block Diagram

The following figure shows the OWA block diagram.

Figure 8-14 OWA Block Diagram

OWA contains the following sub-blocks:

Table 8-7 OWA Sub-blocks

Sub-block	Description
Registers	Analyze the configuration parameter, DMA requests, and IRQ feedbacks.
Transmitter	Sends the data
FSM	Finite state machine
Clock Divider	Clock divider circuit

8.3.3 Functional Description

8.3.3.1 External Signals

The OWA is a Biphase-Mark Encoding Digital Audio Transfer protocol. In this protocol, the CLK signal and data signal are transferred in the same line. The following figure describes the external signals of OWA. OWA-OUT is the output pin for the output CLK and DATA.

Table 8-8 OWA External Signals

Signal Name	Description	Type
OWA-OUT	OWA output	O

8.3.3.2 Clock Sources

The following tables describe the clock sources for OWA. For clock setting, configurations and gating information, refer to section 3.3 “[CCU](#)”.

Table 8-9 OWA Clock Sources

Clock Name	Description
PLL_AUDIO0(1X)	By default, PLL_AUDIO0(1X) is 24.5714 MHz, and PLL_AUDIO0(4X) is 98.2856 MHz.
PLL_AUDIO0(4X)	
PLL_AUDIO1(DIV2)	By default, PLL_AUDIO1 is 3072 MHz, PLL_AUDIO1(DIV2) is 1536 MHz, and
PLL_AUDIO1(DIV5)	PLL_AUDIO1(DIV5) is 614.4 MHz (24.576 MHz*25).

8.3.3.3 Biphase-Mark Code (BMC)

In the OWA format, the digital signal is coded using the biphase-mark code (BMC). The clock, frame, and data are embedded in only one signal—the data pin. In the BMC system, each data bit is encoded into two logical states (00, 01, 10, or 11) at the pin. The following figure and table show how data is encoded to the BMC format.

The frequency of the clock is twice the data bit rate, as shown in the following figure. Also, the clock is always programmed to $128 \times fs$, where fs is the sample rate. The device receiving in the OWA format can recover the clock and frame information from the BMC signal.

Figure 8-15 OWA Biphase-Mark Code

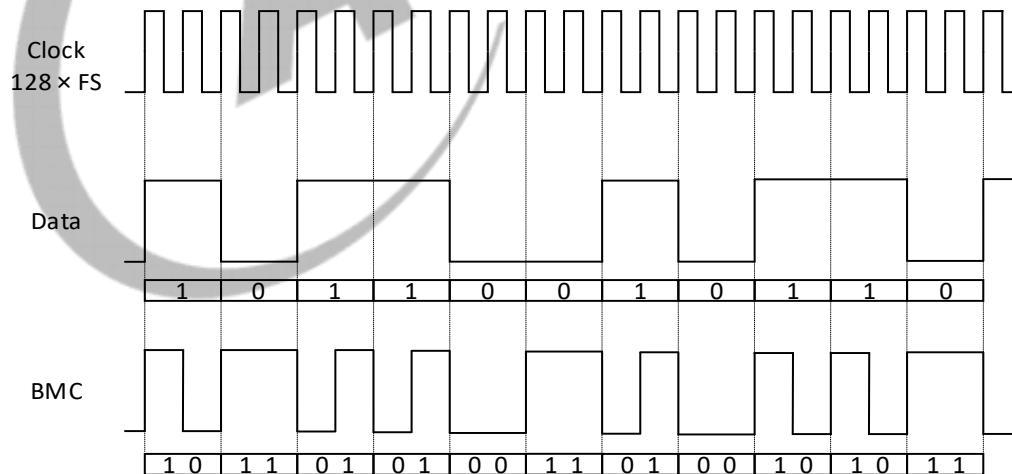

Table 8-10 Biphase-Mark Encoder

Data	Previous State	BMC
0	0	11

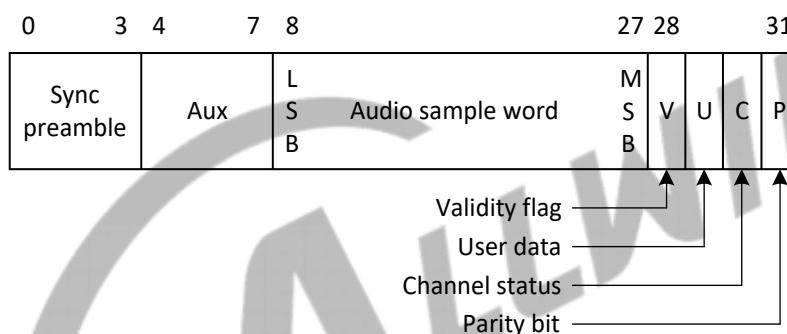

Data	Previous State	BMC
0	1	00
1	0	10
1	1	01

8.3.3.4 OWA Transmit Format

The OWA supports digital audio data transfer and receive. It also supports full-duplex synchronous work mode. The software can set the work mode by the OWA Control Register.

Every audio sample transmitted in a sub-frame consists of 32-bit, numbered from 0 to 31. The following figure shows a sub-frame.

Figure 8-16 OWA Sub-Frame Format

Bits 0-3 carry one of the four permitted preambles to signify the type of audio sample in the current sub-frame. The preamble is not encoded in BMC format, and therefore the preamble code can contain more than two consecutive 0 or 1 logical states in a row.

Bits 4-27 carry the audio sample word in linear 2s-complement representation. The most-significant bit (MSB) is carried by bit 27. When a 24-bit coding range is used, the least-significant bit (LSB) is in bit 4. When a 20-bit coding range is used, bit[8:27] carry the audio sample word with the LSB in bit 8. Bit[4:7] may be used for other applications and are designated auxiliary sample bits.

If the source provides fewer bits than the interface allows (either 20 or 24), the unused LSBs are set to logical 0. For a nonlinear PCM audio application or a data application, the main data field may carry any other information.

Bit 28 carries the validity bit (V) associated with the main data field in the sub-frame.

Bit 29 carries the user data channel (U) associated with the main data field in the sub-frame.

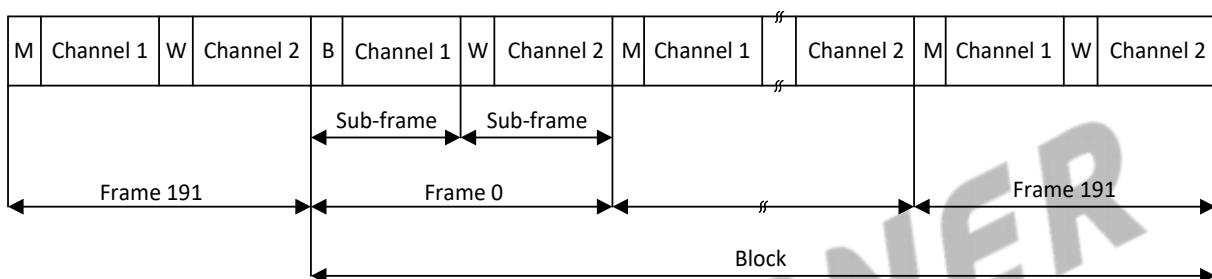

Bit 30 carries the channel status information (C) associated with the main data field in the sub-frame. The channel status indicates if the data in the sub-frame is a digital audio or some other type of data.

Bit 31 carries a parity bit (P) such that bit 4-31 carry an even number of 1s and an even number of 0s (even parity). As shown in the following table, the preambles (bit 0-3) are also defined with even parity.

Table 8-11 Preamble Codes

Preamble Code	Previous Logical State	Logical State	Description
B (or Z)	0	1110 1000	Start of a block and sub-frame 1
M (or X)	0	1110 0010	Sub-frame 1
W (or Y)	0	1110 0100	Sub-frame 2

Figure 8-17 OWA Frame/Block Format

8.3.3.5 Audio Sample Ratio Detection

The sampling rate is calculated according to the data pulse back-stepping method. In the first phase lock of the CDR, find 1 Frame period, count by using the high-speed sampling clock, and read the counting value of the pulse, then the sampling rate can be calculated.

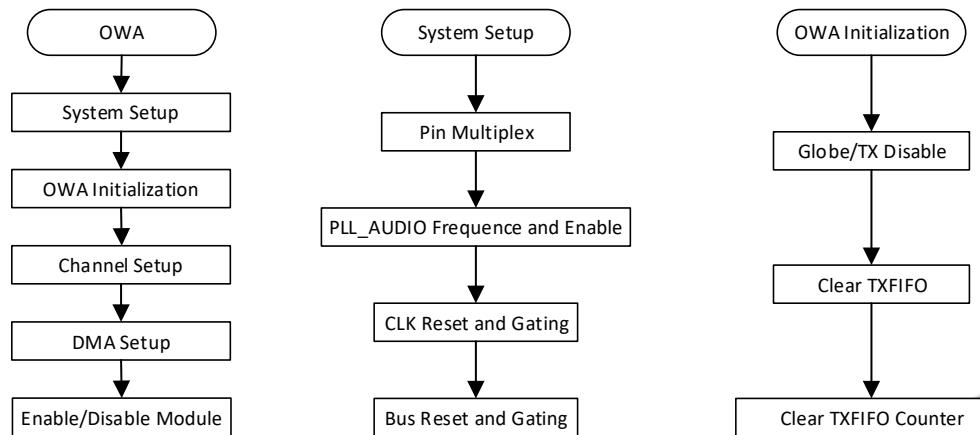

Table 8-12 The Corresponding Relation between Different System Clock and Sample Ratio

22.05	8916(± 5)	9070(± 5)
24	8192(± 5)	8333(± 5)
32	6144(± 5)	6250(± 5)
44.1	4458(± 5)	4535(± 5)
48	4096(± 5)	4166(± 5)
96	2048(± 5)	2083(± 5)
176.4	1114(± 5)	1133(± 5)
192	1024(± 5)	1041(± 5)

8.3.3.6 Operation Modes

The software operation of the OWA is divided into five steps: system setup, OWA initialization, channel setup, DMA setup and enable/disable module. The following sections describe these five steps.

Figure 8-18 OWA Operation Flow

1. System Setup and OWA Initialization

The first step in the OWA initialization is properly programming the GPIO because the OWA port is a multiplex pin. You can find the function in section 9.7 “”.

The clock source for the OWA should be followed. Firstly, reset the audio PLL in [PLL_AUDIOx Control Register](#). Secondly, set up the frequency of the Audio PLL in the [PLL_AUDIOx Control Register](#). After that, enable the OWA gating. Lastly, enable the OWA bus gating.

After the system setup, the register of OWA can be set up. Firstly, reset the OWA by writing 1 to [OWA_CTL\[0\]](#) and clear the TX FIFO by writing 1 to [OWA_FCTL\[17:16\]](#). After that, enable the globe enable bit by writing 1 to [OWA_CTL\[1\]](#) and clear the interrupt and TX counter by setting [OWAISTA](#) and [OWATX_CNT](#).

2. Channel Setup and DMA Setup

You can set up the audio type, clock divider ratio, the sample format, and the trigger level, and so on. The setup of the register can be found in the specification.

The OWA supports two methods to transfer the data. The most common way is DMA, the configuration of DMA can be found in section 3.9 “[DMAC](#)”. In this module, you just enable the DRQ in [OWA_INT\[7\]](#).

3. Enable and Disable OWA

To enable the function, you can enable TX by writing [OWA_TX_CFIG\[31\]](#). After that, enable OWA by writing 1 to [OWA_CTL\[1\]](#). Writing 0 to [OWA_CTL\[1\]](#) to disable process.

8.4 Audio Codec

8.4.1 Overview

The Audio Codec is high-performance audio encoder and decoder module which supports DAC/ADC, dynamic range controller (DRC) and dynamic voltage controller (DVC) functions.

The Audio Codec has the following features:

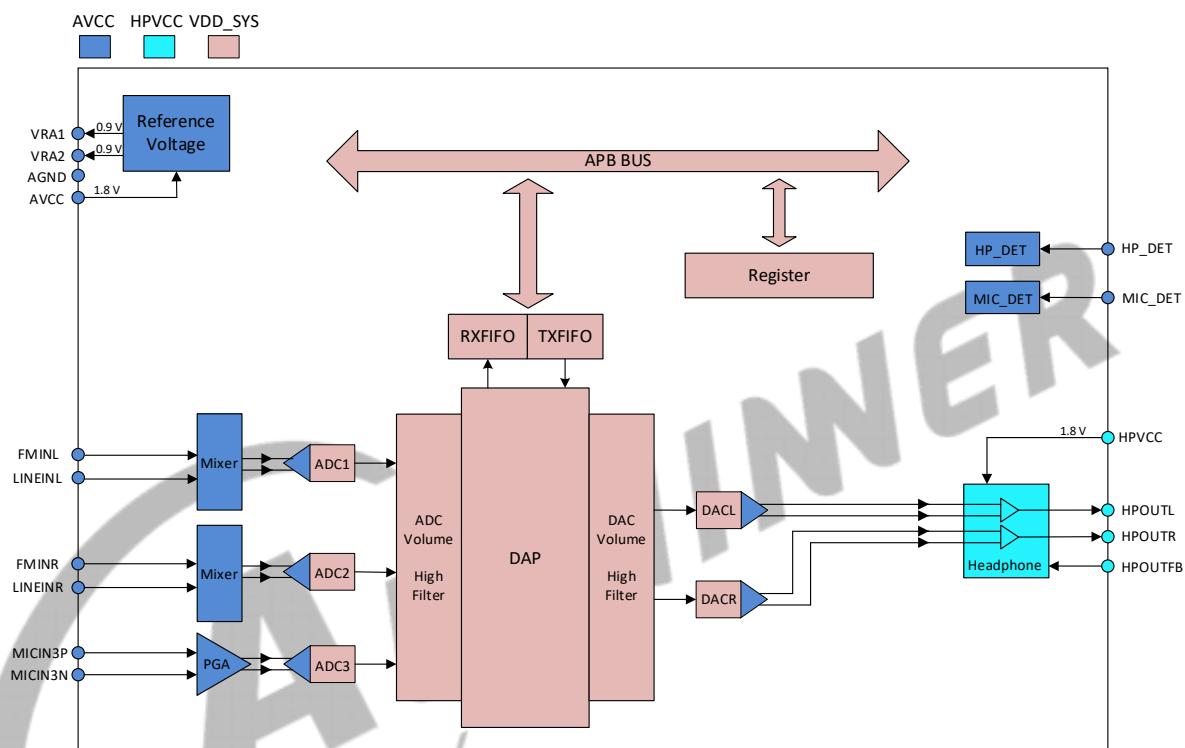

- Two audio digital-to-analog converter (DAC) channels
 - Supports the DAC sample rate from 8 kHz to 192 kHz
 - 100 ± 2 dB SNR@A-weight, -85 ± 3 dB THD + N
 - Supports 16-bit and 20-bit audio sample resolution
- One audio output
 - One stereo headphone output: HPOUTL/R
- Three audio analog-to-digital converter (ADC) channels
 - Supports the ADC sample rate from 8 kHz to 48 kHz
 - 95 ± 3 dB SNR@A-weight, -80 ± 3 dB THD + N
 - Supports 16-bit and 20-bit audio sample resolution
- Three audio inputs
 - One differential microphone input: MICIN3P/3N, or one single-end microphone input: MICIN3P
 - One stereo LINEIN input: LINEINL/R
 - One stereo FMIN input: FMINL/R
- Stereo headphone driver
 - 95 ± 3 dB SNR@A-weight
 - Output Level 0.55 Vrms@ $10 \text{ k}\Omega$ /THD+N - 77 ± 3 dB, 0.37 Vrms@ 16Ω /THD+N - 40 dB
- Supports Dynamic Range Controller (DRC) adjusting the ADC recording and DAC playback
- One 128x20-bit FIFO for DAC data transmit, one 128x20-bit FIFO for ADC data receive
- Programmable FIFO thresholds
- Supports interrupts and DMA
- Internal HPLDO output for HPVCC

- Internal ALDO output for AVCC

8.4.3.2 Clock Sources

The following figure describes the clock source of Audio Codec. For clock setting, configuration, and gating information, refer to section 3.3 “[CCU](#)”.

Figure 8-20 Audio Codec Clock Diagram

The clock source for the digital part is the PLL_AUDIO0 and PLL_AUDIO1. For the ADC clock, configure [AUDIO_CODEC_ADC_CLK_REG\[25:24\]](#) to select the clock source. For the DAC clock, configure

[AUDIO_CODEC_DAC_CLK_REG](#)[25:24] to select the clock source. The PK-PK jitter of PLL_AUDIO0 and PLL_AUDIO1 should be less than 200 ps.

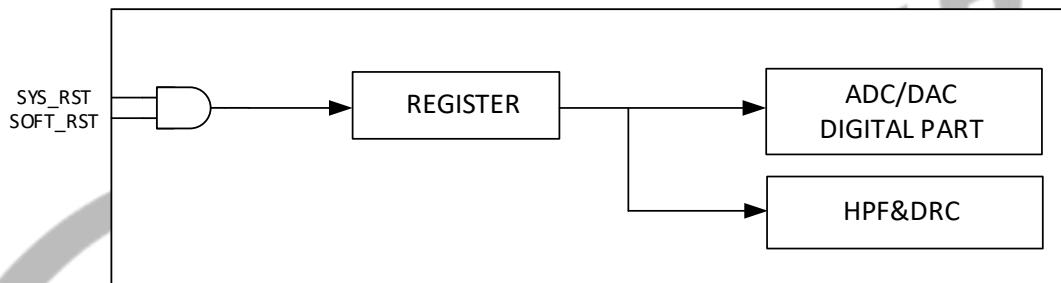

The clock source for the analog part is the CK_ADC and CK_DAC, both of which are divided from the digital part.

8.4.3.3 Reset System

Digital Part Reset System

The following figure shows the reset system of the audio codec digital part.

Figure 8-21 Audio Codec Digital Part Reset System

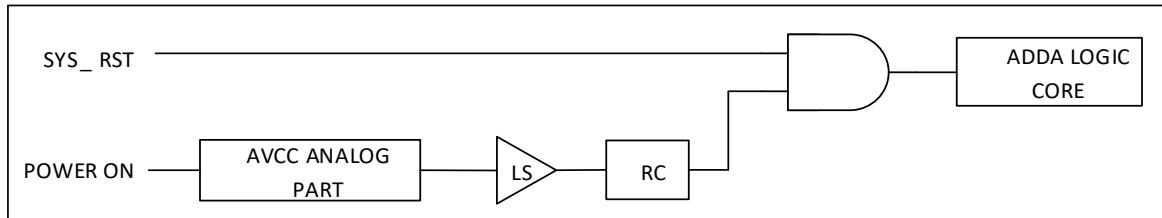

The SYS_RST comes from the VDD-SYS domain and is produced by the RTC domain. Each domain has the debounce to confirm the reset system is strong. For the codec register part, MIX can be reset by the SYS_RST when being powered on or the system soft is writing the reset control logic. The other parts can be reset by the soft configuration through writing the register.

Analog Part Reset System

The following figure shows the reset system of the audio codec analog part.

Figure 8-22 Audio Codec Analog Part Reset System

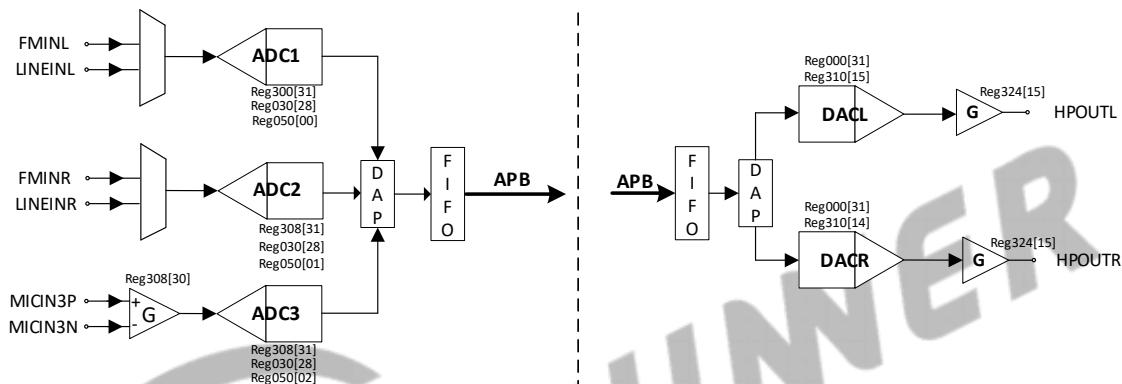

When AVCC is powered on, it sends the AVCC_POR signal. The AVCC_POR signal passes the level shift and RC filter part to the ADDA logic core.

8.4.3.4 Data Path Diagram

The following figure shows a data path of the Audio Codec.

Figure 8-23 Audio Codec Data Path Diagram

8.4.3.5 Three ADCs

The three ADCs are used for recording stereo sound and a reference signal. The sample rates of the three ADCs are independent of the DAC sample rate. The digital ADC part can be enabled or disabled by the bit[28] of the [AC_ADC_FIFOC](#) register.

8.4.3.6 Stereo DAC

The stereo DAC sample rate can be configured by setting the register. To save power, the analog DAACL can be enabled or disabled by setting the bit[15] of the [DAC_REG](#) register, and the analog DACR can be enabled or disabled by setting the bit[14] of the [DAC_REG](#) register. The digital DAC part can be enabled or disabled by the bit[31] of the [AC_DAC_DPC](#) register.

8.4.3.7 Analog Audio Input Path

The Audio Codec supports 3 analog audio input paths:

- MICIN3P/N
- LINEINL/R
- FMINL/R

LINEINL, FMINL provide differential input that can be mixed into the ADC1 record mixer. LINEINR, FMINR provide differential input that can be mixed into the ADC2 record mixer. MICIN3P/N provides differential input. The MICIN is a high impedance, low capacitance input suitable for connecting to various differential microphones of different dynamics and sensitivity. The gain for each pre-amplifier can be set independently.

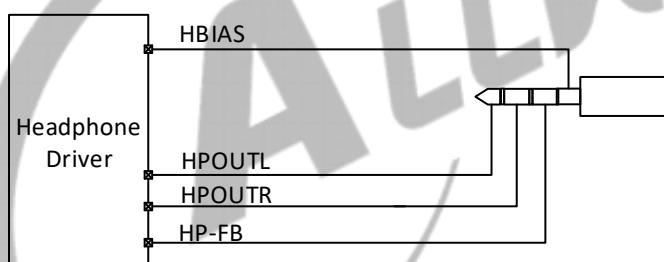

8.4.3.8 Analog Audio Output Path

The Audio Codec has 1 analog output paths:

- HPOUTL/R

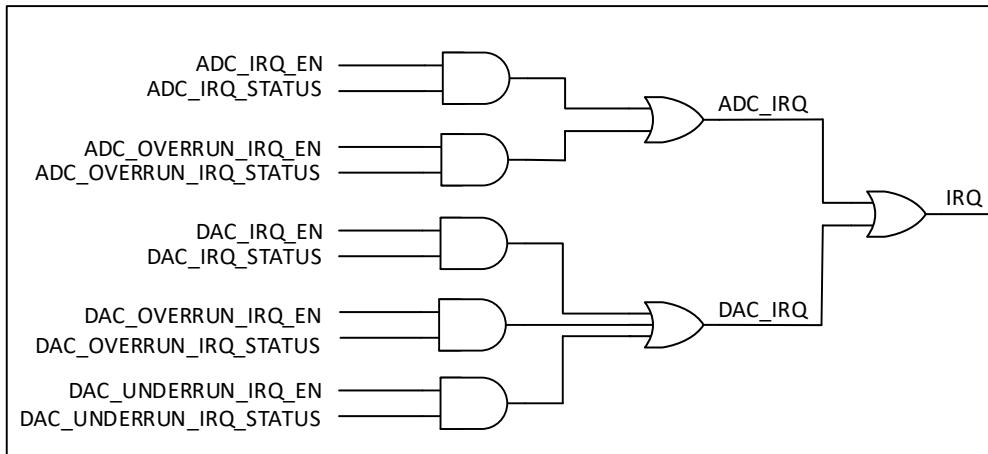

The headphone PA is powered up or down by HP_REG[bit15] (HPPA_EN). HPOUTL/R can drive a 16R or 32R headphone load without DC capacitors by using Charge Pump to generate the negative rails. HP-FB is the ground loop noise rejection feedback.

Figure 8-24 Headphone Output Application

8.4.3.9 Interrupts

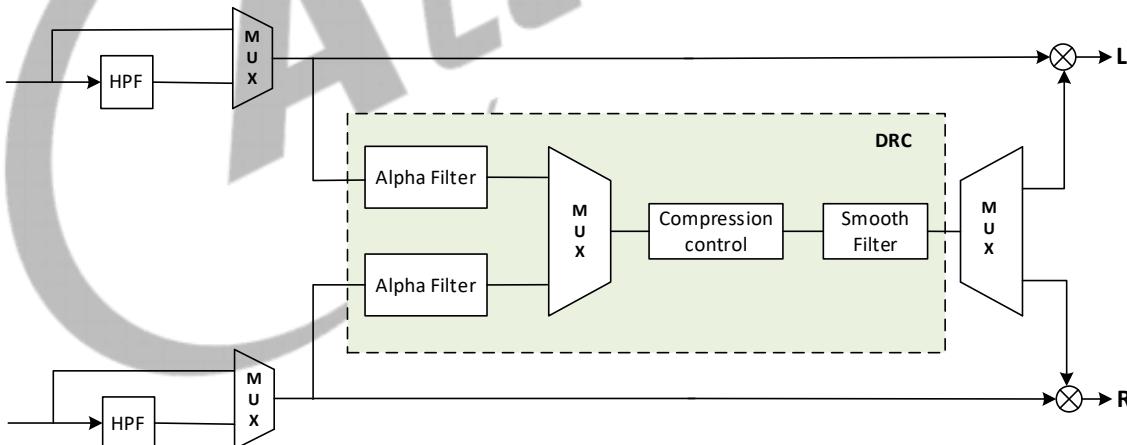

The Audio Codec has two interrupts. The following figure describes the Audio Codec interrupt system.

Figure 8-25 Audio Codec Interrupt System

8.4.3.10 Digital Audio Processor (DAP)

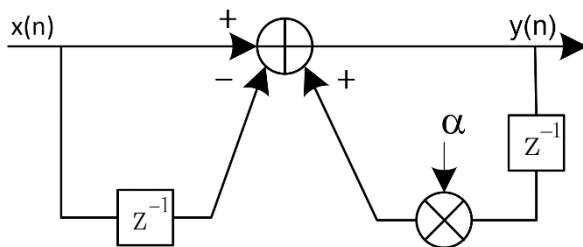

The DAP module is used to remove the DC offset and automatically adjusts the volume to a flatten volume level. It mainly consists of two HPF and one DRC.

The following figure shows the DAP data flow.

Figure 8-26 DAP Data Flow

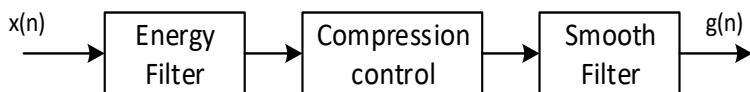

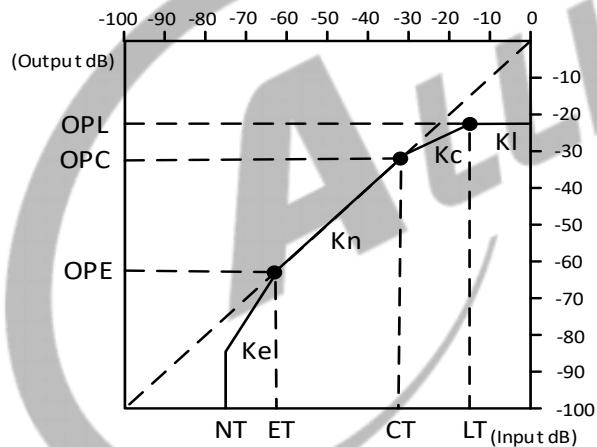

HPF Function

The DAP has individual channel high pass filter (HPF, -3 dB cutoff < 1 Hz) that can be enabled and disabled. The filter cutoff frequency is less than 1 Hz that can be removed DC offset from ADC recording. The HPF can also be bypassed.

Figure 8-27 HPF Logic Structure

DRC Function

The DRC scheme has three thresholds, three offsets, and four slopes (all programmable). There is one ganged DRC for the left and right channels. The following figure shows the diagram of DRC input/output.

Figure 8-28 DRC Block Diagram

Figure 8-29 DRC Static Curve Parameters

Professional-quality dynamic range compression automatically adjusts the volume to flatten volume level.

One DRC for left/right and one DRC for the subwoofer.

Each DRC has an adjustable threshold, offset, and compression levels, programmable energy, attack, and decay time constants.

Transparent compression: Compressors can attack fast enough to avoid apparent clipping before engaging, and decay times can be set slow enough to avoid pumping.

Configure the DRC parameters according to the following guidelines:

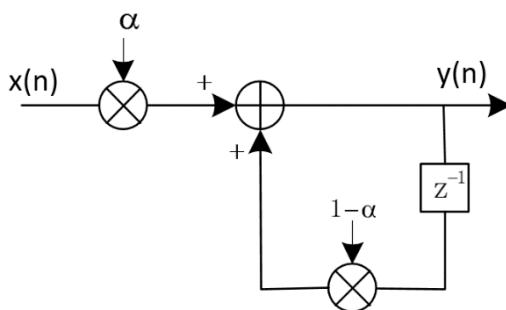

- **Number format**

The Number format is N.M which means there are N bits to the left of the decimal point including the sign bit and M bits to the right of the decimal point. For example, Numbers formatted 9.23 means that there are 9 bits at the left of the decimal point and 23 bits at the right decimal point.

- **Energy Filter**

The following figure shows the structure of the energy filter.

Figure 8-30 Energy Filter Structure

The Energy Filter is to estimate the RMS value of the audio data stream into DRC and has two parameters, which determine the time window over which RMS to be made. The parameter is computed by $\alpha = 1 - e^{-2.2T_s/ta}$.

For the Compression Control, there are ten parameters (ET, CT, LT, Ke, Kn, Kc, Kl, OPL, OPC, and OPE), which are all programmable, and the computation will be explained as follows.

- **Threshold Parameter Computation (T parameter)**

The threshold is the value that determines the signal to be compressed or not. When the RMS of the signal is larger than the threshold, the signal will be compressed. The value of threshold input to the coefficient

$$\text{register is computed by } Tin = -\frac{T_{dB}}{6.0206}.$$

Where, T_{dB} must less than zero, the positive value is illegal.

For example, it is desired to set CT = -40 dB, then the Tin require to set CT to -40 dB is $CTin = -(-40 \text{ dB})/6.0206 = 6.644$, CT_{in} is entered as a 32-bit number in 8.24 format.

Therefore, $CT_{in} = 6.644 = 0000\ 0110.1010\ 0100\ 1101\ 0011\ 1100\ 0000 = 0x06A4\ D3C0$ in 8.24 format.

- **Slope Parameter Computation (K parameter)**

The K is the slope within the compression region. For example, an n: 1 compression means that an output increase of 1 dB is for n dB RMS input. The k input to the coefficient ram is computed by $K = \frac{1}{n}$

Where, n is from 1 to 50, and must be an integer.

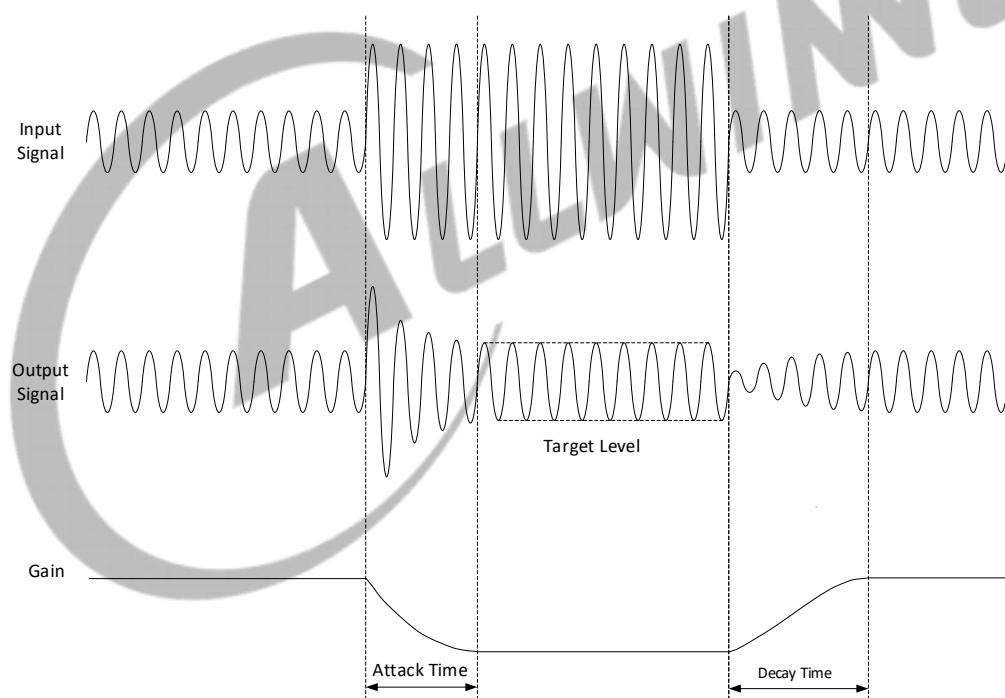

For example, it is desired to set to 2:1, then the Kc requires to set to 2:1, is $K_c = 1/2 = 0.5$, Kc is entered as a 32-bit number in 8.24 format.

Therefore, $K_c = 0.5 = 0000\ 0000.1000\ 0000\ 0000\ 0000\ 0000 = 0x0080\ 0000$ in 8.24 format.

- **Gain Smooth Filter**

The Gain Smooth Filter is to smooth the gain and control the ratio of gain increase and decrease. The decay time and attack are shown in Figure 8-36. The structure of the Gain Smooth filter is also the Alpha filter, so the rise time computation is the same as the Energy filter which is $\alpha = 1 - e^{-2.2Ts/ta}$.

Figure 8-31 Gain Smooth Filter

8.4.4 Programming Guidelines

8.4.4.1 Record Process

In recording mode, the analog audio signals are recorded from the microphones at the specified sample rate, processed by the ADC, and then transferred to the DRAM via the DMA.

- Step 1** Codec initialization: configure [AUDIO_CODEC_BGR_REG](#) to open the audio codec bus clock gating and de-assert bus reset; configure [AUDIO_CODEC_ADC_CLK_REG](#) and [PLL_AUDIO0_CTRL_REG](#) to configure PLL_Audio0 frequency and enable PLL_Audio0. For details, refer to section 3.3 “[CCU](#)”.
- Step 2** Configure the sample rate and data transfer format, then open the ADC.
- Step 3** Configure the DMA and DMA request.
- Step 4** Enable the ADC DRQ and DMA.

8.4.4.2 Playback Process

In playback mode, the audio data are transferred from the DRAM via DMA, processed by the DAC, and finally output via the analog interface.

- Step 1** Codec initialization: configure [AUDIO_CODEC_BGR_REG](#) to open the audio codec bus clock gating and de-assert bus reset; configure [AUDIO_CODEC_DAC_CLK_REG](#) and [PLL_AUDIO1_CTRL_REG](#) to configure PLL_Audio1 frequency and enable PLL_Audio1. For details, refer to section 3.3 “[CCU](#)”.
- Step 2** Configure the sample rate and data transfer format, then open the DAC.
- Step 3** Configure the DMA and DMA request.
- Step 4** Enable the DAC DRQ and DMA.

9 Interfaces

9.1 TWI

9.1.1 Overview

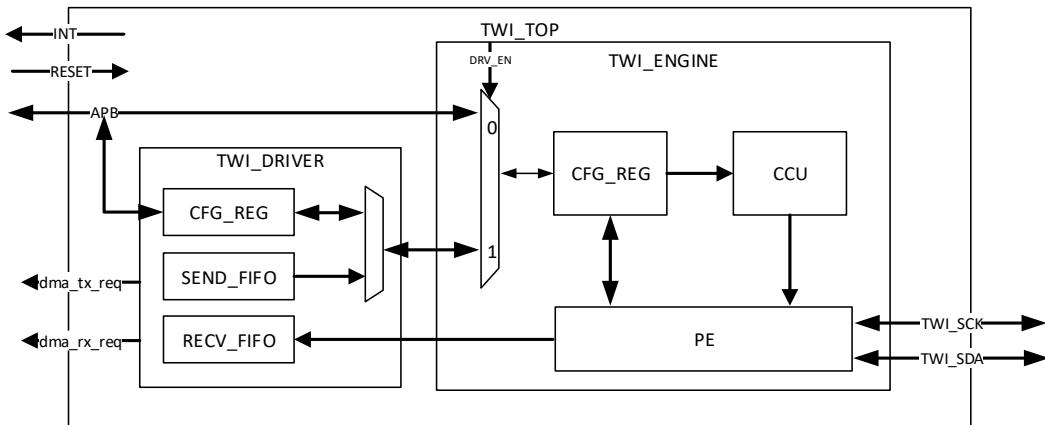

The Two Wire Interface (TWI) provides an interface between a CPU and any TWI-bus-compatible device that connects via the TWI bus. The TWI is designed to be compatible with the standard I2C bus protocol. The communication of the TWI is carried out by a byte-wise mode based on interrupt polled handshaking. Each device on the TWI bus is recognized by a unique address and can operate as either transmitter or receiver, a device connected to the TWI bus can be considered as master or slave when performing data transfers. Note that a master device is a device that initiates a data transfer on the bus and generates the clock signals to permit the transfer. During this transfer, any device addressed by this master is considered a slave.

The TWI has the following features:

- Compliant with I2C bus standard
- Supports standard mode (up to 100 kbit/s) and fast mode (up to 400 kbit/s)
- Supports 7-bit and 10-bit device addressing modes
- Supports master mode or slave mode
- Master mode features:
 - Supports the bus arbitration in the case of multiple master devices
 - Supports clock synchronization and bit and byte waiting
 - Supports packet transmission and DMA
- Slave mode features:
 - Interrupt on address detection
- The TWI controller includes one TWI engine and one TWI driver. And the TWI driver supports packet transmission and DMA mode when TWI works in master mode

9.1.2 Block Diagram

Figure 9-1 shows the block diagram of TWI.

Figure 9-1 TWI Block Diagram

TWI contains the following sub-blocks:

Table 9-1 TWI Sub-blocks

Sub-block	Description
RESET	Module reset signal
INT	Module output interrupt signal
CFG_REG	Module configuration register in TWI
PE	Packet encoding/decoding
CCU	Module clock controller unit
SEND_FIFO	The register address bytes and the written data bytes are buffered in SEND_FIFO
RECV_FIFO	The read data bytes are buffered in RECV_FIFO

The controller includes TWI engine and TWI driver. Each time the TWI engine sends a START signal, a STOP signal, or a BYTE data, or a corresponding ACK, the TWI engine will generate an interrupt, and wait for the CPU to process and clear the interrupt before the next START, STOP, or BYTE, ACK transmission can be performed. Therefore, when a device communication is completed, many interrupts will be generated, and the CPU needs to wait for the previous interrupt before it can configure the next one. The TWI driver defines each communication with the device as a packet transmission. The CPU can directly configure the slave address, register address and data transmission for one or more package transmissions without waiting for interruption, then start the TWI driver, and the TWI driver can control the TWI engine to complete a pre-configured communication, and report an interrupt to the CPU after completion.

9.1.3 Functional Description

9.1.3.1 External Signals

The TWI controller has 4 TWI modules called TWI0, TWI1, TWI2, and TWI3. The following table describes the external signals of the TWI. The TWIn-SCK and TWIn-SDA are bidirectional I/O, when the TWI is configured as a master device, the TWIn-SCK is an output pin; when the TWI is configurable as a slave device, the TWIn-SCK is an input pin. When using TWI, the corresponding PADs are selected as TWI function via section 9.7 “[GPIO](#)”.

Table 9-2 TWI External Signals

Signal	Description	Type
TWI0-SCK	TWI0 Clock Signal	I/O, OD
TWI0-SDA	TWI0 Serial Data	I/O, OD
TWI1-SCK	TWI1 Clock Signal	I/O, OD
TWI1-SDA	TWI1 Serial Data	I/O, OD
TWI2-SCK	TWI2 Clock Signal	I/O, OD
TWI2-SDA	TWI2 Serial Data	I/O, OD
TWI3-SCK	TWI3 Clock Signal	I/O, OD
TWI3-SDA	TWI3 Serial Data	I/O, OD

9.1.3.2 Clock Sources

Each TWI controller has an input clock source. The following table describes the clock sources for TWI. After selecting a proper clock, users must open the gating of TWI and release the corresponding reset bit.

For more details on the clock setting, configuration, and gating information, see section 3.3 “[CCU](#)”.

9.1.3.3 Write/Read Timing in Standard and Extended Addressing Mode

This section is the 7-bit/10-bit addressing mode of the entire TWI protocol to read and write device registers. It can be achieved by directly using the TWI engine or using the TWI driver to control the TWI engine.

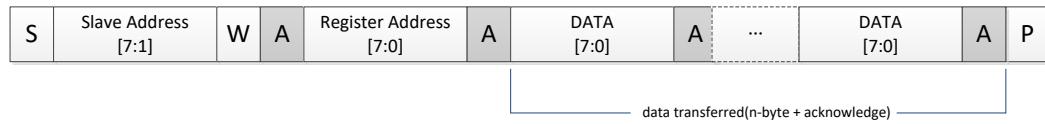

Figure 9-2 describes the write timing in 7-bit standard addressing mode.

9.1.3.4 Write/Read Packet Transmission of TWI Driver

The TWI driver is only supported for master mode. When the TWI works in master mode, the TWI driver drives the TWI engine for one or more packet transmission instead of the CPU host. Packet transmission is defined in the following figures. The register address bytes and the written data bytes are buffered in SEND_FIFO, the read data bytes are buffered in RECV_FIFO.

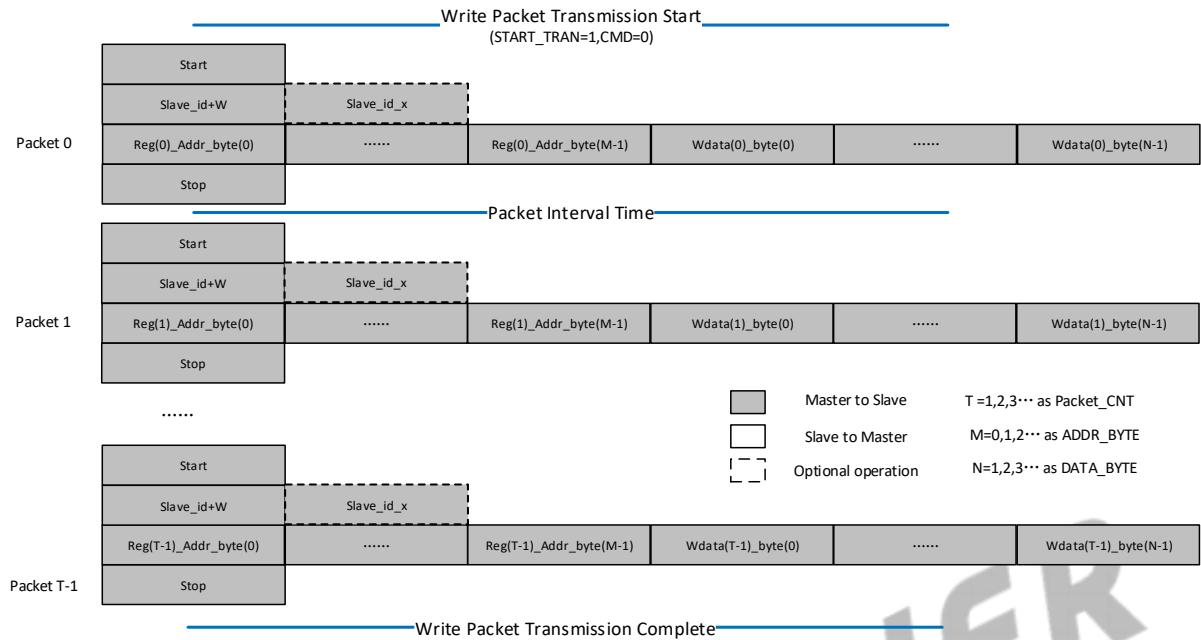

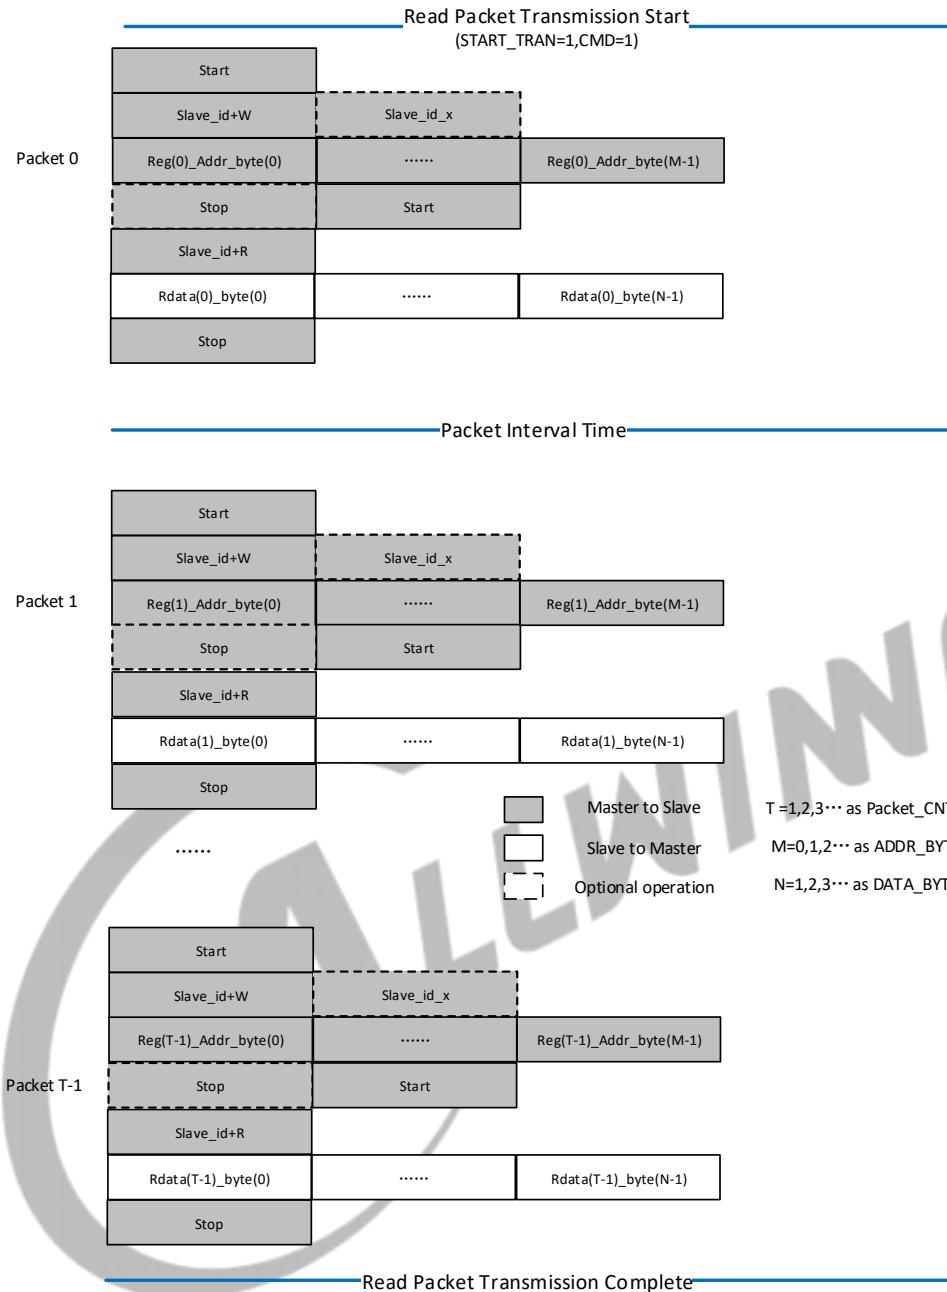

Figure 9-6 TWI Driver Write Packet Transmission

Figure 9-7 TWI Driver Read Packet Transmission

9.1.3.5 Master and Slave Mode of TWI Engine

In Master mode, the CPU host controls the TWI engine by writing command and data to its registers. The TWI engine transmits an interrupt to CPU when each time a byte transfer is done or a START/STOP command is detected. The CPU host can poll the status register if the interrupt mechanism is not disabled by the CPU host.

When the CPU host wants to start a bus transfer, it initiates a bus START to enter the master mode by setting [TWI_CNTR\[M_STA\]](#) to high. The TWI engine will assert the INT line and [TWI_CNTR\[INT_FLAG\]](#) to indicate a completion for the START command and each consequent byte transfer. At each interrupt, the CPU host needs

to check the current state by the [TWI_STAT](#) register. A transfer must conclude with the STOP command by setting [TWI_CNTR\[M_STP\]](#) to high.

In Slave mode, the TWI engine also constantly samples the bus and look for its own slave address during addressing cycles. Once a match is found, it is addressed, and the TWI engine interrupts the CPU host with the corresponding status. Upon request, the CPU host should read the status, read/write the [TWI_DATA](#) register, and set the [TWI_CNTR](#) register. After each byte transfer, a slave device always stops the operation of the remote master by holding the next low pulse on the SCL line until the CPU host responds to the status of the previous byte transfer or START command.

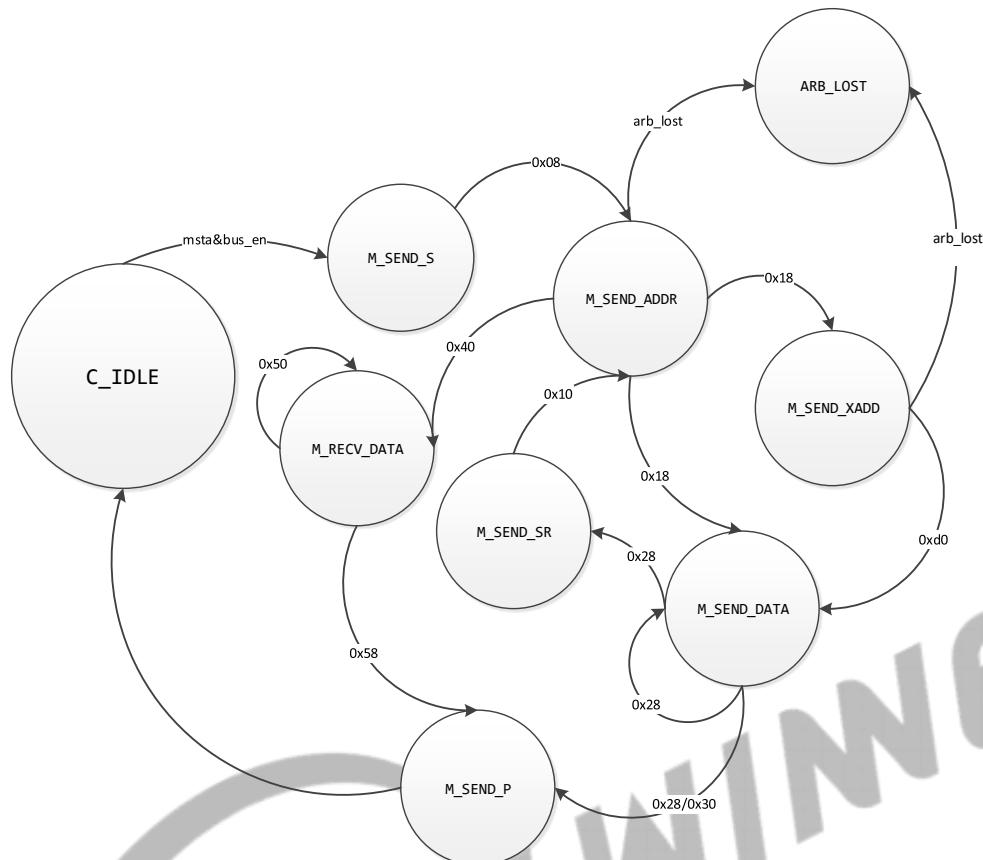

9.1.3.6 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

9.1.3.7 Programming State Diagram

Figure 9-8 shows the TWI programming state diagram. For the value between two states, see the [TWI_STAT](#) register in section 9.1.6.5.

- M_SEND_S: master sends START signal;
- M_SEND_ADDR: master sends slave address;
- M_SEND_XADD: master sends slave extended address;
- M_SEND_SR: master repeated start;
- M_SEND_DATA: master sends data;
- M_SEND_P: master sends STOP signal;
- M_RECV_DATA: master receives data;
- ARB_LOST: Arbitration lost;
- C_IDLE: Idle.

9.1.4 Programming Guidelines

The TWI controller operates in an 8-bit data format. The data on the TWI_SDA line is always 8 bits long. At first, the TWI controller sends a start condition. When in the addressing formats of 7-bit, the TWI sends out an 8-bit message which includes 7 MSB slave address and 1 LSB read/write flag. The least significant of the slave address indicates the direction of transmission. When the TWI works in 10-bit slave address mode, the operation will be divided into two steps, for details on the operation, refer to register description in Section 9.1.6.1 and 9.1.6.2.

The following takes the TWI module in the CPUX domain as an example.

9.1.4.1 Initialization for TWI Engine

To initialize the TWI engine, perform the following steps:

- Step 1** Configure corresponding GPIO multiplex function as TWI mode.
- Step 2** For TWIn, set [TWI_BGR_REG\[TWIn_GATING\]](#) in CCU module to 0 to close TWIn clock.
- Step 3** For TWIn, set [TWI_BGR_REG\[TWIn_RST\]](#) in CCU module to 0, then set to 1 to reset TWIn.

- Step 4** For TWIn, set [TWI_BGR_REG](#)[TWIn_GATING] in CCU module to 1 to open TWIn clock.
- Step 5** Configure [TWI_CCR](#)[CLK_M] and [TWI_CCR](#)[CLK_N] to get the needed rate (The clock source of TWI is from APB1).
- Step 6** Configure [TWI_CNTR](#)[BUS_EN] and [TWI_CNTR](#)[A_ACK], when using interrupt mode, set [TWI_CNTR](#)[INT_EN] to 1, and register the system interrupt through GIC module. In slave mode, configure [TWI_ADDR](#) and [TWI_XADDR](#) registers to finish TWI initialization configuration.

9.1.4.2 Writing Data Operation for TWI Engine

To write data to the device, perform the following steps:

- Step 1** Clear [TWI_EFR](#) register, and configure [TWI_CNTR](#)[M_STA] to 1 to transmit the START signal.
- Step 2** After the START signal is transmitted, the first interrupt is triggered, then write device ID to [TWI_DATA](#) (For a 10-bit device ID, firstly write the first byte ID, secondly write the second byte ID in the next interrupt).
- Step 3** The Interrupt is triggered again after device ID transmission completes, write device data address to be read to [TWI_DATA](#) (For a 16-bit address, firstly write the first-byte address, secondly write the second-byte address).
- Step 4** Interrupt is triggered after data address transmission completes, write data to be transmitted to [TWI_DATA](#) (For consecutive write data operation, every byte transmission completion triggers interrupt, during interrupt write the next byte data to [TWI_DATA](#)).
- Step 5** After transmission completes, write [TWI_CNTR](#)[M_STP] to 1 to transmit the STOP signal and end this write-operation.

9.1.4.3 Reading Data Operation for TWI Engine

To read data from the device, perform the following steps:

- Step 1** Clear [TWI_EFR](#) register, and set [TWI_CNTR](#)[A_ACK] to 1, and configure [TWI_CNTR](#)[M_STA] to 1 to transmit the START signal.
- Step 2** After the START signal is transmitted, the first interrupt is triggered, then write device ID to [TWI_DATA](#) (For a 10-bit device ID, firstly write the first-byte ID, secondly write the second-byte ID in the next interrupt).
- Step 3** The Interrupt is triggered again after device ID transmission completes, write device data address to be read to [TWI_DATA](#) (For a 16-bit address, firstly write the first-byte address, secondly write the second-byte address).

- Step 4** The Interrupt is triggered after data address transmission completes, write [TWI_CNTR\[M_STA\]](#) to 1 to transmit new START signal, and after interrupt triggers, write device ID to [TWI_DATA](#) to start read-operation.
- Step 5** After device address transmission completes, each receive completion will trigger an interrupt, in turn, read [TWI_DATA](#) to get data, when receiving the previous interrupt of the last byte data, clear [C:\Users\zengjing\Downloads\Hlk50046436 - Hlk50051279\[A_ACK\]](C:\Users\zengjing\Downloads\Hlk50046436 - Hlk50051279[A_ACK]) to stop acknowledge signal of the last byte.
- Step 6** Write [TWI_CNTR\[M_STP\]](#) to 1 to transmit the STOP signal and end this read-operation.

9.1.4.4 Initialization for TWI Driver

To initialize the TWI driver, perform the following steps:

- Step 1** Configure corresponding GPIO multiplex function as TWI mode.
- Step 2** For TWIn, set [TWI_BGR_REG\[TWIN_GATING\]](#) in CCU module to 0 to close TWIn clock.
- Step 3** For TWIn, set [TWI_BGR_REG\[TWIN_RST\]](#) in CCU module to 0, then set to 1 to reset TWIn.
- Step 4** For TWIn, set [TWI_BGR_REG\[TWIN_GATING\]](#) in CCU module to 1 to open TWIn clock.
- Step 5** Set [TWI_DRV_CTRL\[TWI_DRV_EN\]](#) to 1 to enable the TWI driver.
- Step 6** Configure [TWI_DRV_BUS_CTRL\[CLK_M\]](#) and [TWI_DRV_BUS_CTRL\[CLK_N\]](#) to get the needed rate (The clock source of TWI is from APB1).
- Step 7** Set [TWI_DRV_CTRL\[RESTART_MODE\]](#) to 0 and <C:\Users\zengjing\Downloads\Hlk50051373 - Hlk50051463>[READ_TRAN_MODE] to 1, set [TWI_DRV_INT_CTRL\[TRAN_COM_INT_EN\]](#) to 1.
- Step 8** When using DMA for data transmission, set [TWI_DRV_DMA_CFG\[DMA_RX_EN\]](#) and [TWI_DRV_DMA_CFG\[DMA_TX_EN\]](#) to 1, and configure [TWI_DRV_DMA_CFG\[RX_TRIG\]](#) and [TWI_DRV_DMA_CFG\[TX_TRIG\]](#) to set the thresholds of RXFIFO and TXFIFO.

9.1.4.5 Writing Packet Transmission for TWI Driver

To write package to the device, perform the following steps:

- Step 1** Configure [TWI_DRV_SLV\[SLV_ID\]](#) to set the device ID, and configure [TWI_DRV_SLV\[CMD\]](#) to 0 to set the write operation.
- Step 2** Configure [TWI_DRV_FMT\[ADDR_BYTE\]](#) according to the address width of the device register, and [TWI_DRV_FMT\[DATA_BYTE\]](#) according to the written data count in a packet.
- Step 3** Configure [TWI_DRV_CFG\[PACKET_CNT\]](#) to set the written packet number.

- Step 4** Configure DMA channel, including TWI TXFIFO, device register address, and the written data.
- Step 5** Set <C:\Users\zengjing\Downloads\Hlk50051463 - Hlk50051932>[START_TRAN] to 1 to start TWI Driver transmission.
- Step 6** When TWI driver transmission completes, the interrupt is triggered, it indicates that the write packet transmission ends.

9.1.4.6 Reading Packet Transmission for TWI Driver

To read package from the device, perform the following steps:

- Step 1** Configure [TWI_DRV_SLV](#)[SLV_ID] to set the device ID, and configure [TWI_DRV_SLV](#)[CMD] to 1 to set the read operation.
- Step 2** Configure [TWI_DRV_FMT](#)[ADDR_BYTE] according to the address width of the device register, and [TWI_DRV_FMT](#)[DATA_BYTE] according to the read data count in a packet.
- Step 3** Configure [TWI_DRV_CFG](#)[PACKET_CNT] to set the read packet number.
- Step 4** Configure DMA channel, including TWI TXFIFO, TWI RXFIFO, device register address and the read data.
- Step 5** Set <C:\Users\zengjing\Downloads\Hlk50051463 - Hlk50051932>[START_TRAN] to 1 to start TWI Driver transmission.
- Step 6** When TWI driver transmission completes, the interrupt is triggered, it indicates that the read packet transmission ends.

9.1.6 Register Description

9.1.6.1 0x0000 TWI Slave Address Register (Default Value: 0x0000_0000)

Offset: 0x0000			Register Name: TWI_ADDR
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/
7:1	R/W	0x0	SLA Slave Address For 7-bit addressing, the bit[7:1] indicates: SLA6, SLA5, SLA4, SLA3, SLA2, SLA1, SLA0 For 10-bit addressing, the bit[7:1] indicates: 1, 1, 1, 1, 0, SLAX[9:8]
0	R/W	0x0	GCE General Call Address Enable 0: Disable 1: Enable

For 7-bit addressing:

SLA6 – SLA0 is the 7-bit address of the TWI in slave mode. When the TWI receives this address after a START condition, it will generate an interrupt and enter slave mode. (SLA6 corresponds to the first bit received from the TWI bus.) If GCE is set to ‘1’, the TWI will also recognize the general call address (00h).

For 10-bit addressing:

When the address received starts with b'11110, the TWI recognizes b'11110 as the first part of a 10-bit address and if the next two bits match ADDR[2:1] (For example, SLAX9 and SLAX8 for the extended address of the device), it sends an ACK. (The device does not generate an interrupt at this point.) If the next byte of the address matches the XADDR register (SLAX7 – SLAX0), the TWI generates an interrupt and goes into slave mode.

9.1.6.2 0x0004 TWI Extend Address Register (Default Value: 0x0000_0000)

Offset: 0x0004			Register Name: TWI_XADDR
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/
7:0	R/W	0x0	SLAX Extend Slave Address SLAX[7:0]

9.1.6.3 0x0008 TWI Data Register (Default Value: 0x0000_0000)

Offset: 0x0008			Register Name: TWI_DATA
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/
7:0	R/W	0x0	TWI_DATA Data byte transmitted or received

9.1.6.4 0x000C TWI Control Register (Default Value: 0x0000_0000)

Offset: 0x000C			Register Name: TWI_CNTR
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/

Offset: 0x000C			Register Name: TWI_CNTR
Bit	Read/Write	Default/Hex	Description
7	R/W	0x0	<p>INT_EN</p> <p>Interrupt Enable</p> <p>0: The interrupt line always low</p> <p>1: The interrupt line will go high when INT_FLAG is set.</p>

5	R/WAC	0x0	<p>M_STA</p> <p>Master Mode Start</p> <p>When the M_STA is set to '1', the TWI controller enters master mode and will transmit a START condition on the bus when the bus is free. If the M_STA bit is set to '1' when the TWI controller is already in master mode and one or more bytes have been transmitted, then a repeated START condition will be sent. If the M_STA bit is set to '1' when the TWI is accessed in slave mode, the TWI will complete the data transfer in slave mode then enter master mode when the bus has been released.</p> <p>The M_STA bit is cleared automatically after a START condition has been sent. Writing a '0' to this bit has no effect.</p>
4	R/W1C	0x0	<p>M_STP</p> <p>Master Mode Stop</p> <p>If the M_STP is set to '1' in master mode, a STOP condition is transmitted on the TWI bus. If the M_STP bit is set to '1' in slave mode, the TWI will indicate if a STOP condition has been received, but no STOP condition will be transmitted on the TWI bus. If both M_STA and M_STP bits are set, the TWI will first transmit the STOP condition (if in master mode), then transmit the START condition.</p> <p>The M_STP bit is cleared automatically. Writing a '0' to this bit has no effect.</p>

Offset: 0x000C			Register Name: TWI_CNTR
Bit	Read/Write	Default/Hex	Description
3	R/W1C	0x0	<p>INT_FLAG Interrupt Flag</p> <p>The INT_FLAG is automatically set to '1' when any of the 28 (out of the possible 29) states is entered (see 'STAT Register' below). The state that does not set INT_FLAG is state F8h. If the INT_EN bit is set, the interrupt line goes high when INT_FLAG is set to '1'. If the TWI is operating in slave mode, the data transfer is suspended when INT_FLAG is set and the low period of the TWI bus clock line (SCL) is stretched until '1' is written to INT_FLAG. The TWI clock line is then released and the interrupt line goes low.</p>
2	R/W	0x0	<p>A_ACK Assert Acknowledge</p> <p>When A_ACK is set to '1', an Acknowledge (low level on SDA) will be sent during the acknowledge clock pulse on the TWI bus if:</p> <ul style="list-style-type: none"> (1). Either the whole of a matching 7-bit slave address or the first or the second byte of a matching 10-bit slave address has been received. (2). The general call address has been received and the GCE bit in the ADDR register is set to '1'. (3). A data byte has been received in master or slave mode. <p>When A_ACK is '0', a Not Acknowledge (high level on SDA) will be sent when a data byte is received in master or slave mode.</p> <p>If A_ACK is cleared to '0' in slave transmitter mode, the byte in the DATA register is assumed to be the 'last byte'. After this byte has been transmitted, the TWI will enter state C8h then return to the idle state (status code F8h) when INT_FLAG is cleared.</p> <p>The TWI will not respond as a slave unless A_ACK is set.</p>

7	R/W	0x1	CLK_DUTY Setting duty cycle of clock as master 0: 50% 1: 40%
6:3	R/W	0x0	CLK_M The TWI SCL output frequency, in master mode, is F1/10: $F1 = F0/(CLK_M + 1)$ $F_{SCL} = F1/10 = Fin/(2^{CLK_N} * (CLK_M + 1)*10)$ Specially, $F_{SCL} = F1/11$ when $CLK_M=0$ and $CLK_DUTY=40\%$ due to the delay of SCL sample debounce.
2:0	R/W	0x0	CLK_N The TWI bus is sampled by the TWI at the frequency defined by F0: $F_{SAMP} = F0 = Fin/2^{CLK_N}$ The TWI SCL output frequency, in master mode, is F1/10: $F1 = F0/(CLK_M + 1)$ $F_{SCL} = F1/10 = Fin/(2^{CLK_N} * (CLK_M + 1)*10)$ Specially, $F_{SCL} = F1/11$ when $CLK_M=0$ and $CLK_DUTY=40\%$ due to the delay of SCL sample debounce. For Example: Fin = 24 MHz (APB clock input) For 400 kHz full speed 2-wire, CLK_N = 1, CLK_M = 2 $F0 = 24 \text{ MHz}/2^1 = 12 \text{ MHz}$, $F1 = F0/(10*(2+1)) = 0.4 \text{ MHz}$ For 100 kHz standard speed 2-wire, CLK_N = 1, CLK_M = 11 $F0 = 24 \text{ MHz}/2^1 = 12 \text{ MHz}$, $F1 = F0/(10*(11+1)) = 0.1 \text{ MHz}$

9.2 UART

9.2.1 Overview

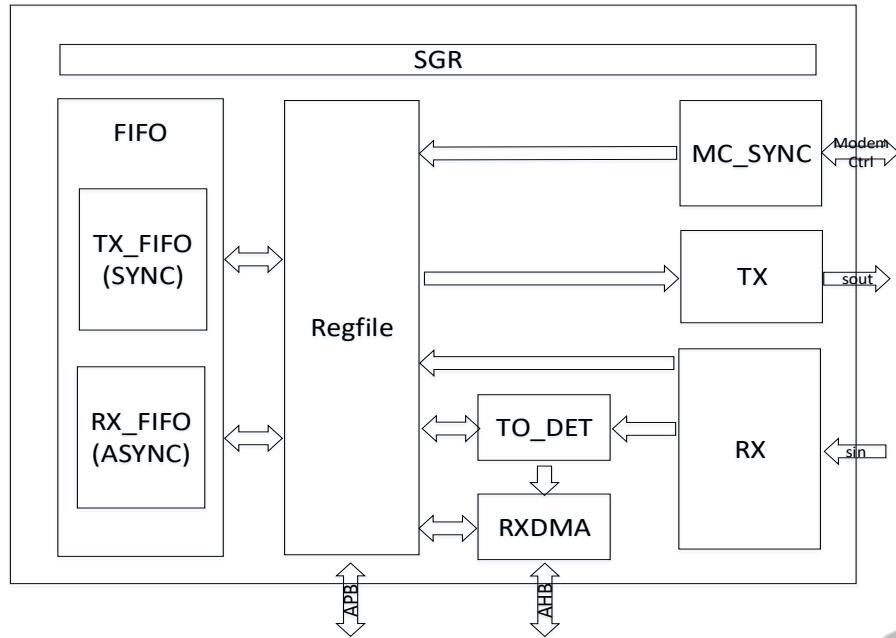

The universal asynchronous receiver transmitter (UART) provides an asynchronous serial communication with external devices, modem (data carrier equipment, DCE). It performs serial-to-parallel conversion on the data received from peripherals and transmits the converted data to the internal bus. It also performs parallel-to-serial conversion on the data that is transmitted to peripherals.

The UART has the following features:

- Compatible with industry-standard 16450/16550 UARTs
- Supports IrDA-compatible slow infrared (SIR) format
- Two separate FIFOs: one is RX FIFO, and the other is TX FIFO
 - Each of them is 64 bytes (For UART0)
 - Each of them is 256 bytes (For UART1, UART2, UART3, UART4, and UART5)
- The working reference clock is from the APB bus clock
 - Speed up to 4 Mbit/s with 64 MHz APB clock
 - Speed up to 1.5 Mbit/s with 24 MHz APB clock
- 5 to 8 data bits for RS-232 characters, or 9 bits RS-485 format
- 1, 1.5 or 2 stop bits
- Programmable parity (even, odd, or no parity)
- Supports TX/RX DMA slave controller interface
- Supports software/hardware flow control
- Supports RX DMA Master interface (Only for UART1)
- Supports auto-flow by using CTS & RTS (Only for UART1/2/3)

9.2.3.4 UART Operating Mode

Data Frame Format

The [UART_LCR](#) register can set the basic parameter of a data frame: data width (5 to 8 bits), stop bit number (1/1.5/2), parity type.

A frame transfer of the UART includes the start signal, data signal, parity bit, and stop signal. The LSB is transmitted first.

- Start signal (start bit): It is the start flag of a data frame. According to the UART protocol, the low level of the TXD signal indicates the start of a data frame. When the UART transmits data, the level needs to hold high.
- Data signal (data bit): The data bit width can be configured as 5-bit, 6-bit, 7-bit, and 8-bit through different applications.
- Parity bit: It is a 1-bit error correction signal. Parity bit includes odd parity, even parity. The UART can enable and disable the parity bit by setting the [UART_LCR](#) register.
- Stop Signal (stop bit): It is the stop bit of a data frame. The stop bit can be set to 1-bit, 1.5-bit, and 2-bit by the [UART_LCR](#) register. The high level of the TXD signal indicates the end of a data frame.

Baud and Error Rates

The baud rate is calculated as follows: Baud rate = SCLK/(16 * divisor).

The SCLK is usually APB1 and can be set in section 3.3 "[CCU](#)".

The divisor is frequency divider of UART. The frequency divider has 16-bit, the low 8-bit is in the [UART_DLL](#) register, the high 8-bit is in the [UART_DLH](#) register.

The relationship between the different UART mode and the error rate is as follows.

DLAB Definition

The DLAB control bit ([UART_LCR](#)[7]) is the access control bit of the divisor Latch register.

If DLAB is 0, then the 0x00 offset address is the [UART_RBR/UART_THR](#) (RX/TX FIFO) register, and the 0x04 offset address is the [UART_IER](#) register.

If DLAB is 1, then the 0x00 offset address is the [UART_DLL](#) register, and the 0x04 offset address is the [UART_DLH](#) register.

When the UART initials, the divisor needs to be set. That is, writing 1 to DLAB can access the [UART_DLL](#) and [UART_DLH](#) register, after finished the configuration, writing 0 to DLAB can access the [UART_RBR/UART_THR](#) register.

CHCFG_AT_BUSY Definition

The function of the CHCFG_AT_BUSY ([UART_HALT](#)[1]) and CHANGE_UPDATE ([UART_HALT](#)[2]) are as follows.

CHCFG_AT_BUSY: Enable the bit, the software can also set the UART controller when UART is busy, such as the [UART_LCR](#), [UART_DLH](#), [UART_DLL](#) register.

CHANGE_UPDATE: If CHCFG_AT_BUSY is enabled, and CHANGE_UPDATE is written to 1, the configuration of the UART controller can be updated. After completed the update, the bit is cleared to 0 automatically.

Setting divisor performs the following steps:

Step 1 Write 1 to CHCFG_AT_BUSY to enable “configure at busy”.

Step 2 Write 1 to DLAB ([UART_LCR](#)[7]) and set the [UART_DLH](#) and [UART_DLL](#) registers.

Step 3 Write 1 to CHANGE_UPDATE to update the configuration. The bit is cleared to 0 automatically after completing the update.

UART Busy Flag

The [UART_USR](#)[0] is a busy flag of the UART controller.

When the TX transmits data, or the RX receives data, or the TX FIFO is not empty, or the RX FIFO is not empty, then the busy flag bit can be set to 1 by hardware, which indicates the UART controller is busy.

9.2.4 Programming Guidelines

The following takes the UART module in the CPUX domain as an example.

9.2.4.1 Initialization

Step 1 System Initialization

- Configure [APB1_CFG_REG](#) in the CCU module to set the APB1 bus clock (The clock is 24MHz by default).
- Set [UART_BGR_REG](#)[UARTx_GATING] to 1 to enable the module clock, and set [UART_BGR_REG](#)[UARTx_RST] to 1 to de-assert the module.

Step 2 UART Controller Initialization

- IO configuration: Configure GPIO multiplex as UART function, and set UART pins to internal pull-up mode (For detail, see the description in section 9.7 “[GPIO](#)”).
- Baud-rate configuration:
 - Set UART baud-rate (refer to section 9.2.3.4);
 - Write [UART_FCR](#)[FIFOE] to 1 to enable TX/RX FIFO;
 - Write [UART_HALT](#)[HALT_TX] to 1 to disable TX transfer;
 - Set [UART_LCR](#)[DLAB] to 1, remain default configuration for other bits; set 0x00 offset address to the [UART_DLL](#) register, set 0x04 offset address to the [UART_DLH](#) register;
 - Write the high 8-bit of divisor to the [UART_DLH](#) register, and write the low 8-bit of divisor to the [UART_DLL](#) register;
 - Set [UART_LCR](#)[DLAB] to 0, remain default configuration for other bits; set 0x00 offset address to the [UART_RBR/UART_THR](#) register, set 0x04 offset address to the [UART_IER](#) register;
 - Set [UART_HALT](#)[HALT_TX] to 0 to enable TX transfer.

Step 3 Controller Parameter Configuration

- Set data width, stop bits, and even/odd parity type by writing the [UART_LCR](#) register.
- Reset, enable FIFO and set FIFO trigger condition by writing the [UART_FCR](#) register.
- Set the flow control parameter by writing the [UART_MCR](#) register.

Step 4 Interrupt Configuration

- Configure UART interrupt vector number to request UART interrupt (Refer to section 3.8 “GIC” module for interrupt vector number).
- In DMA mode, write [UART_IER](#) to 0 to disable interrupt; write [UART_HSK](#)[Handshake configuration] to 0xE5 to set DMA handshake mode; write [UART_FCR](#)[DMAM] to 1 to set DMA transmission/reception mode; set DMA parameter and request DMA interrupt according to DMA configuration process.

- In Interrupt mode, configure [UART_IER](#) to enable the corresponding interrupt according to requirements: such as transmit (TX) interrupt, receive (RX) interrupt, receive line status interrupt, RS48 interrupt, etc. (Here TX/RX interrupt is usually used).

9.2.4.2 Transferring/Receiving Data in Query Mode

Data transfer

Step 1 Write data to [UART_THR](#) to start data transfer.

Step 2 Check TX_FIFO status by reading [UART_USR](#)[TFNF]. If the bit is 1, data can continue to be written; if the bit is 0, wait for data transfer, and data cannot continue to write until FIFO is not full.

Data receive

Step 1 Check RX_FIFO status by reading [UART_USR](#)[RFNE].

Step 2 Read data from [UART_RBR](#) if RX_FIFO is not empty.

Step 3 If [UART_USR](#)[RFNE] is 0, data is received completely.

9.2.4.3 Transferring/Receiving Data in Interrupt Mode

Data transfer

Step 1 Set [UART_IER](#)[ETBEI] to 1 to enable the *UART transmission interrupt*.

Step 2 Write the data to be transmitted to [UART_THR](#).

Step 3 When the data of TX_FIFO meets trigger condition (such as FIFO/2, FIFO/4), the UART transfer interrupt is generated.

Step 4 Check [UART_USR](#)[TFE] and determine whether TX_FIFO is empty. If [UART_USR](#)[TFE] is 1, it indicates that the data in TX_FIFO is transmitted completely.

Step 5 Clear [UART_IER](#)[ETBEI] to 0 to disable transfer interrupt.

Data receive

Step 1 Set [UART_IER](#)[ERBFI] to 1 to enable the *UART reception interrupt*.

Step 2 When the received data from RX_FIFO meets trigger condition (such as FIFO/2, FIFO/4), the UART receive interrupt is generated.

Step 3 Read data from [UART_RBR](#).

Step 4 Check RX_FIFO status by reading [UART_USR](#)[RFNE] and determine whether to read data. If the bit is 1, continue to read data from [UART_RBR](#) until [UART_USR](#)[RFNE] is cleared to 0, which indicates data is received completely.

9.2.4.4 Transferring/Receiving Data in DMA Mode

Data transfer

Step 1 Configure the UART DMA interrupt according to the initialization process.

Step 2 Configure DMA data channel, including the transfer source address, the transfer destination address, the number of data to be transferred, and the transfer type, and so on. (For details, see section 3.9 “[DMAC](#)”).

Step 3 Enable the DMA transfer function of the UART by setting the register of the DMA module.

Step 4 Determine whether UART data is transferred completely based on the DMA status. If all data is transferred completely, disable the DMA transfer function of the UART.

Data receive

Step 1 Configure DMA data channel, including the transfer source address, the transfer destination address, the number of data to be transferred, and the transfer type, and so on. (For details, see section 3.9 “[DMAC](#)”).

Step 2 Enable the DMA receive function of the UART by setting the register of the DMA module.

Step 3 Determine whether UART data is received completely based on the DMA status. If all data is received completely, disable the DMA receive function of the UART.

9.2.6 Register Description

9.2.6.1 0x0000 UART Receiver Buffer Register (Default Value: 0x0000_0000)

Offset: 0x0000			Register Name: UART_RBR
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/
7:0	R	0x0	<p>RBR Receiver Buffer Register Data byte received on the serial input port (sin) in UART mode, or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in UART_LCR is set. If in FIFO mode and FIFOs are enabled (The UART_FCR[0] is set to 1), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register can not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data are lost and an overrun error occurs.</p>

9.2.6.2 0x0000 UART Transmit Holding Register (Default Value: 0x0000_0000)

Offset: 0x0000			Register Name: UART_THR
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/

Offset: 0x0000			Register Name: UART_THR
Bit	Read/Write	Default/Hex	Description
7:0	W	0x0	<p>THR</p> <p>Transmit Holding Register</p> <p>Data is transmitted on the serial output port (SOUT) in UART mode or the serial infrared output (sir_out_n) in infrared mode.</p> <p>Data should only be written to the UART_THR when the THRE bit (UART_LSR[5]) is set.</p> <p>If in FIFO mode and FIFOs are enabled (UART_FCR[0] = 1) and THRE is set, the 16 number of characters data may be written to the UART_THR before the FIFO is full. When the FIFO is full, any written data results in the written data being lost.</p>

9.2.6.3 0x0000 UART Divisor Latch Low Register (Default Value: 0x0000_0000)

Offset: 0x0000			Register Name: UART_DLL
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/
7:0	R/W	0x0	<p>DLL</p> <p>Divisor Latch Low</p> <p>Lower 8 bits of 16 bits, read/write, Divisor Latch Register contains the baud rate divisor for the UART. This register may only be accessed when the DLAB bit (UART_LCR[7]) is set and the UART is not busy (UART_USR[0] is 0).</p> <p>The output baud rate is equal to the serial clock (SCLK) frequency divided by sixteen times the value of the baud rate divisor, as follows: baud rate = (serial clock freq)/(16 * divisor).</p> <p>Note that when the Divisor Latch Registers (UART_DLL and UART_DLH) are set to 0, the baud clock is disabled and no serial communications occur. Also, once the DLL is set, at least 8 clock cycles of the slowest UART clock should be allowed to pass before transmitting or receiving data.</p>

9.2.6.4 0x0004 UART Divisor Latch High Register (Default Value: 0x0000_0000)

Offset: 0x0004			Register Name: UART_DLH
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/

Offset: 0x0004			Register Name: UART_DLH
Bit	Read/Write	Default/Hex	Description
7:0	R/W	0x0	<p>DLH Divisor Latch High Upper 8 bits of 16 bits, read/write, Divisor Latch Register contains the baud rate divisor for the UART. This register may only be accessed when the DLAB bit (UART_LCR[7]) is set and the UART is not busy (UART_USR[0] is 0).</p> <p>The output baud rate is equal to the serial clock (SCLK) frequency divided by sixteen times the value of the baud rate divisor, as follows: baud rate = (serial clock freq)/(16 * divisor).</p> <p>Note that when the Divisor Latch Registers (UART_DLL and UART_DLH) is set to 0, the baud clock is disabled and no serial communications occur. Also, once the DLH is set, at least 8 clock cycles of the slowest UART clock should be allowed to pass before transmitting or receiving data.</p>

9.2.6.5 0x0004 UART Interrupt Enable Register (Default Value: 0x0000_0000)

Offset: 0x0004			Register Name: UART_IER
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/
7	R/W	0x0	<p>PTIME Programmable THRE Interrupt Mode Enable This is used to enable/disable the generation of THRE Interrupt. 0: Disable 1: Enable</p>
6:5	/	/	/
4	R/W	0x0	<p>RS485_INT_EN RS485 Interrupt Enable 0: Disable 1: Enable</p>
3	R/W	0x0	<p>EDSSI Enable Modem Status Interrupt This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt. 0: Disable 1: Enable</p>

Offset: 0x0004			Register Name: UART_IER
Bit	Read/Write	Default/Hex	Description
2	R/W	0x0	<p>ELSI Enable Receiver Line Status Interrupt This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt. 0: Disable 1: Enable</p>
1	R/W	0x0	<p>ETBEI Enable Transmit Holding Register Empty Interrupt This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third-highest priority interrupt. 0: Disable 1: Enable</p>
0	R/W	0x0	<p>ERBFI Enable Received Data Available Interrupt This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFOs enabled). These are the second-highest priority interrupt. 0: Disable 1: Enable</p>

9.2.6.6 0x0008 UART Interrupt Identity Register (Default Value: 0x0000_0001)

Offset: 0x0008			Register Name: UART_IIR
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/
7:6	R	0x0	<p>FEFLAG FIFOs Enable Flag This is used to indicate whether the FIFOs are enabled or disabled. 00: Disable 11: Enable</p>
5:4	/	/	/

Offset: 0x0008			Register Name: UART_IIR
Bit	Read/Write	Default/Hex	Description
3:0	R	0x1	<p>IID Interrupt ID This indicates the highest priority pending interrupt which can be one of the following types.</p> <p>0000: modem status 0001: no interrupt pending 0010: THR empty 0011: RS485 Interrupt 0100: received data available 0110: receiver line status 0111: busy detect 1100: character timeout The bit 3 indicates an interrupt can only occur when the FIFOs are enabled and used to distinguish a Character Timeout condition interrupt.</p>

Interrupt ID	Priority Level	Interrupt Type	Interrupt Source	Interrupt Reset
0001	-	None	None	-
0110	Highest	Receiver line status	Overrun/parity/framing errors or break interrupt	Reading the line status register
0011	Second	RS485 Interrupt	In RS485 mode, receives address data and match setting address	Writes 1 to addr flag to reset
0100	Third	Received data available	Receiver data available (non-FIFO mode or FIFOs disabled) or RCVR FIFO trigger level reached (FIFO mode and FIFOs enabled)	Reading the receiver buffer register (non-FIFO mode or FIFOs disabled) or the FIFO drops below the trigger level (FIFO mode and FIFOs enabled)
1100	Fourth	Character timeout indication	No characters in or out of the RCVR FIFO during the last 4 character times and there is at least 1character in it during This time	Reading the receiver buffer register

Interrupt ID	Priority Level	Interrupt Type	Interrupt Source	Interrupt Reset
0010	Fifth	Transmit holding register empty	Transmitter holding register empty (Program THRE mode disabled) or XMIT FIFO at or below threshold (Program THRE mode enabled)	Reading the IIR register (if the source of interrupt); or, writing into THR (FIFOs or THRE mode not selected or disabled) or XMIT FIFO above threshold (FIFOs and THRE mode selected and enabled).
0000	Sixth	Modem status	Clear to send or data set ready or ring indicator or data carrier detect. Note that if the autoflow control mode is enabled, a change in CTS (that is, DCTS set) does not cause an interrupt.	Reading the Modem status register
0111	Seventh	Busy detect indication	UART_16550_COMPATIBLE = NO and master has tried to write to the Line Control Register while the UART is busy (USR[0] is set to one).	Reading the UART status register

9.2.6.7 0x0008 UART FIFO Control Register (Default Value: 0x0000_0000)

Offset: 0x0008			Register Name: UART_FCR
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/
7:6	W	0x0	<p>RT RCVR Trigger</p> <p>This is used to select the trigger level in the receiver FIFO when the Received Data Available Interrupt is generated. In the autoflow control mode, it is used to determine when the rts_n signal is de-asserted. It also determines when the dma_rx_req_n signal is asserted in certain modes of operation.</p> <p>00: 1 character in the FIFO 01: FIFO ¼ full 10: FIFO ½ full 11: FIFO-2 less than full</p>

Offset: 0x0008			Register Name: UART_FCR

3	W	0x0	<p>DMAM</p> <p>DMA Mode</p> <p>0: Mode 0</p> <p>In this mode, when the PTE in UART_HALT is high and TX FIFO is enabled, the TX DMA request will be set when the TFL in UART_TFL is less than or equal to FIFO Trigger Level (otherwise it will be cleared). When the PTE is high and TX FIFO is disabled, the TX DMA request will be set only if the THR in UART_THR is empty. If the PTE is low, the TX DMA request will be set only if the TX FIFO (TX FIFO enabled) or THR (TX FIFO disabled) is empty.</p> <p>When the DMA_PTE_RX in UART_HALT is high and RX FIFO is enabled, the RX DRQ will be set only if the RFL in UART_RFL is equal to or more than FIFO Trigger Level, otherwise, it will be cleared.</p> <p>1: Mode 1</p> <p>In this mode, TX FIFO should be enabled. If the PTE in UART_HALT is high, the TX DMA request will be set when the TFL in UART_TFL is less than or equal to FIFO Trigger Level; If the PTE is low, the TX DMA request will be set when TX FIFO is empty. Once the request is set, it is cleared only when TX FIFO is full.</p> <p>If the RFL in UART_RFL is equal to or more than FIFO Trigger Level or there is a character timeout, the RX DRQ will be set; Once the RX DRQ is set, it is cleared only when RX FIFO (RX FIFO enabled) or RBR (RX FIFO disabled) is empty.</p>
2	W	0x0	<p>XFIFOR</p> <p>XMIT FIFO Reset</p> <p>The bit resets the control part of the transfer FIFO and treats the FIFO as empty. This also de-asserts the DMA TX request.</p> <p>It is 'self-cleared'. It is not necessary to clear this bit.</p>

1	W	0x0	<p>RFIFOR RCVR FIFO Reset</p> <p>The bit resets the control part of the receive FIFO and treats the FIFO as empty. This also de-asserts the DMA RX request.</p> <p>It is 'self-cleared'. It is not necessary to clear this bit.</p>
0	W	0x0	<p>FIFOE Enable FIFOs</p> <p>The bit enables/disables the transmitting (XMIT) and receiving (RCVR) FIFOs. Whenever the value of this bit is changed, both the XMIT and RCVR controller part of FIFOs is reset.</p>

9.2.6.8 0x000C UART Line Control Register (Default Value: 0x0000_0000)

Offset: 0x000C			Register Name: UART_LCR
Bit	Read/Write	Default/Hex	Description
31:8	/	/	/
7	R/W	0x0	<p>DLAB Divisor Latch Access Bit</p> <p>It is writable only when UART is not busy (UART_USR[0] is 0) and always readable. This bit is used to enable the reading and writing of the Divisor Latch register (UART_DLL and UART_DLH) to set the baud rate of the UART. This bit must be cleared after the initial baud rate setup in order to access other registers.</p> <p>0: Select RX Buffer Register (UART_RBR)/TX Holding Register (UART_THR) and Interrupt Enable Register (UART_IER)</p> <p>1: Select Divisor Latch LS Register (UART_DLL) and Divisor Latch MS Register (UART_DLM)</p>
6	R/W	0x0	<p>BC Break Control Bit</p> <p>This is used to cause a break condition to be transmitted to the receiving device. If set to 0, the serial output is forced to the spacing (logic 0) state. When not in Loopback mode, as determined by UART_MCR[4], the SOUT line is forced low until the Break bit is cleared. If SIR_MODE is enabled and active (UART_MCR[6] is set to 1), the sir_out_n line is continuously pulsed. When in Loopback mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.</p>

Offset: 0x000C			Register Name: UART_LCR
Bit	Read/Write	Default/Hex	Description
5:4	R/W	0x0	<p>EPS Even Parity Select</p> <p>It is writable only when UART is not busy (UART_USR[0] is 0). 4	R/W	0x0	<p>LOOP Loop Back Mode 0: Normal Mode 1: Loop Back Mode</p> <p>This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled or not active, UART_MCR[6] is set to 0), the data on the SOUT line is held high, while serial data output is looped back to the sin line, internally. In this mode, all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, UART_MCR[6] is set to 1), the data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.</p>

1	R/W	0x0	<p>RTS Request to Send</p> <p>This is used to directly control the Request to Send (rts_n) output. The RTS (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (UART_MCR[5] is set to 0), the rts_n signal is set low by programming UART_MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (UART_MCR[5] is set to 1) and FIFOs enable (UART_FCR[0] is set to 1), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when UART_MCR[1] is set low.</p> <p>0: rts_n de-asserted (logic 1) 1: rts_n asserted (logic 0)</p> <p>Note that in Loopback mode (UART_MCR[4] is set to 1), the rts_n output is held inactive high while the value of this location is internally looped back to an input.</p>

7	R	0x0	<p>FIFOERR RX Data Error in FIFO</p> <p>When FIFOs are disabled, this bit is always 0. When FIFOs are enabled, this bit is set to "1" when there is at least one PE, FE, or BI in the RX FIFO. It is cleared by reading from the UART_LSR register, there are no subsequent errors in the FIFO.</p>
6	R	0x1	<p>TEMT Transmitter Empty</p> <p>If the FIFOs are disabled, this bit is set to "1" whenever the TX Holding Register (UART_THR) and the TX Shift Register are empty. If the FIFOs are enabled, this bit is set whenever the TX FIFO and the TX Shift Register are empty. In both cases, this bit is cleared when a byte is written to the TX data channel.</p>

Offset:0x0014			Register Name: UART_LSR
Bit	Read/Write	Default/Hex	Description
5	R	0x1	<p>THRE TX Holding Register Empty</p> <p>If the FIFOs are disabled, this bit is set to "1" when the TX Holding Register (UART_THR) is empty and ready to accept new data and it is cleared when the CPU writes to the TX Holding Register.</p> <p>If the FIFOs are enabled, this bit is set to "1" whenever the TX FIFO is empty and it is cleared when at least one byte is written to the TX FIFO.</p>

3	RC	0x0	<p>FE Framing Error</p> <p>This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data.</p> <p>In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (UART_LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (UART_LSR[4]).</p> <p>0: no framing error 1: framing error</p> <p>Reading the UART_LSR clears the FE bit.</p>
2	RC	0x0	<p>PE Parity Error</p> <p>This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (UART_LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (UART_LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (UART_LSR[4]).</p> <p>0: no parity error 1: parity error</p> <p>Reading the UART_LSR clears the PE bit.</p>

1	RC	0x0	<p>OE Overrun Error</p> <p>This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the UART_RBR. When this happens, the data in the UART_RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost.</p> <p>0: no overrun error 1: overrun error</p> <p>Reading the UART_LSR clears the OE bit.</p>

9.3 SPI

9.3.1 Overview

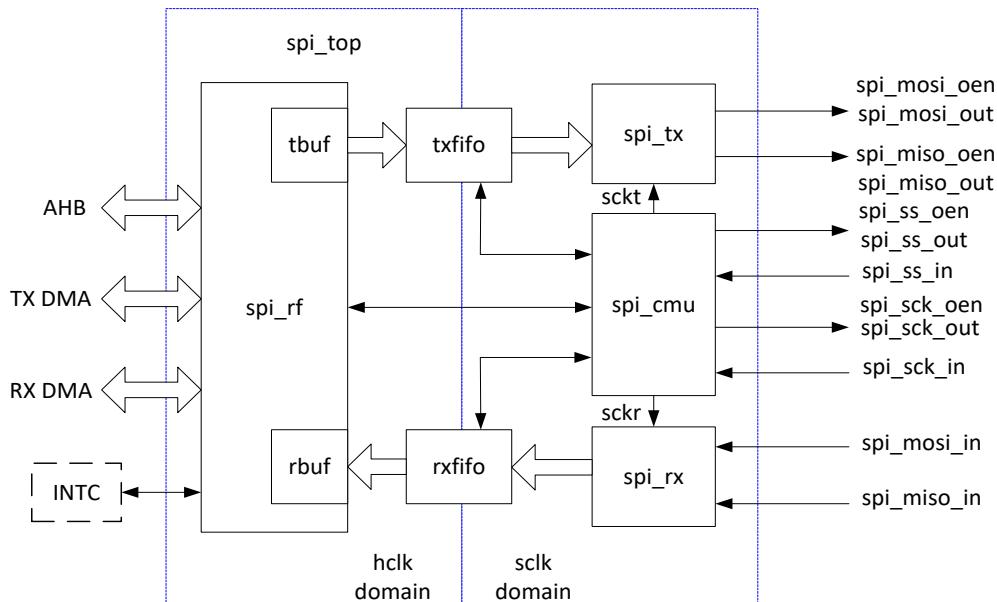

The Serial Peripheral Interface (SPI) is a full-duplex, synchronous, four-wire serial communication interface between a CPU and SPI-compliant external devices. The SPI controller contains a 64 x 8 bits receiver buffer (RXFIFO) and a 64 x 8 bits transmit buffer (TXFIFO). It can work in master mode and slave mode.

The SPI has the following features:

- Full-duplex synchronous serial interface
- Master/slave configurable
- 8-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SPI_SS) and SPI Clock (SPI_SCLK) are configurable
- Supports interrupts and DMA
- Supports mode0, mode1, mode2, and mode3
- Supports 3-wire/4-wire SPI
- Supports programmable serial data frame length: 1 bit to 32 bits
- Supports standard SPI, dual-output/dual-input SPI, dual I/O SPI, quad-output/quad-input SPI
- Supports maximum IO rate of the mass production: 100 MHz

9.3.2 Block Diagram

Figure 9-20 shows a block diagram of the SPI.

Figure 9-20 SPI Block Diagram

SPI contains the following sub-blocks:

Table 9-6 SPI Sub-blocks

Sub-block	Description
spi_rf	Responsible for implementing the internal register, interrupt, and DMA Request.
spi_tbuf	The data length transmitted from AHB to TXFIFO is converted into 8 bits, then the data is written into the RXFIFO.
spi_rbuf	The block is used to convert the RXFIFO data into the reading data length of AHB.
txfifo, rxfifo	The data transmitted from the SPI to the external serial device is written into the TXFIFO; the data received from the external serial device into SPI is pushed into the RXFIFO.
spi_cmu	Responsible for implementing SPI bus clock, chip select, internal sample, and the generation of transfer clock.
spi_tx	Responsible for implementing SPI data transfer, the interface of the internal TXFIFO, and status register.
spi_rx	Responsible for implementing SPI data receive, the interface of the internal RXFIFO, and status register.

9.3.3 Functional Description

9.3.3.1 External Signals

The following table describes the external signals of SPI. The MOSI and MISO are bidirectional I/O, when SPI is as a master device, the CLK and CS are the output pin; when SPI is as a slave device, the CLK and CS are the input pin. When using SPI, the corresponding PADs are selected as SPI function via section 9.7 “[GPIO](#)”.

Table 9-7 SPI External Signals

Signal	Description	Type
SPI0-CS	SPI0 chip select signal, low active When the device is not selected, data will not be accepted via the SI pin, and the SO pin will stop transmission.	I/O
SPI0-CLK	SPI0 clock signal This pin is used to provide a clock to the device and is used to control the flow of data to and from the device.	I/O
SPI0-MOSI	SPI0 master data out, slave data in	I/O
SPI0-MISO	SPI0 master data in, slave data out	I/O
SPI0-WP	Write protection and low active It also can be used for serial data input and output for SPI Quad Input or Quad Output mode.	I/O
SPI0-HOLD	When the device is selected and a serial sequence is underway, the HOLD pin can be used to temporarily pause the serial communication with the master device without deselecting or resetting the serial sequence. While the HOLD pin is asserted, the SO pin is at high impedance, and all transitions on the SCK pin and data on the SI pin are ignored. It also can be used for serial data input and output for SPI Quad Input or Quad Output mode.	I/O

9.3.3.2 Clock Sources

The SPI controller gets 5 different clock sources, users can select one of them to make SPI clock source. The following table describes the clock sources for SPI. For more details on the clock setting, configuration, and gating information, see section 3.3 “[CCU](#)”.

Table 9-8 SPI Clock Sources

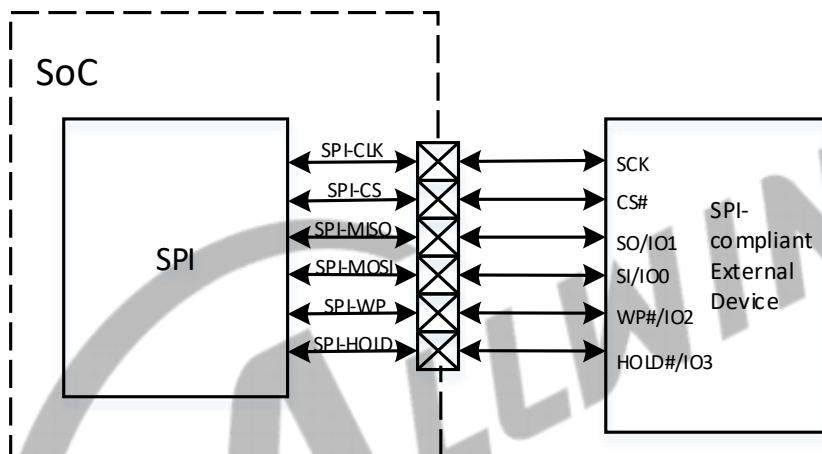

Clock Sources	Description
HOSC	24 MHz Crystal

Clock Sources	Description
PLL_PERI(1X)	Peripheral Clock, default value is 600 MHz
PLL_PERI(2X)	Peripheral Clock, default value is 1200 MHz
PLL_AUDIO0(DIV2)	Audio Clock, the default value is 1536 MHz
PLL_AUDIO0(DIV5)	Audio Clock, the default value is 614.4 MHz

9.3.3.3 Typical Application

Figure 9-21 shows the application block diagram when the SPI master device is connected to a slave device.

Figure 9-21 SPI Application Block Diagram

9.3.3.4 SPI Transmit Format

The SPI supports 4 different formats for data transfer. The software can select one of the four modes in which the SPI works by setting the bit1 (Polarity) and bit0 (Phase) of [SPI_TCR](#). The SPI controller master uses the SPI_SCLK signal to transfer data in and out of the shift register. Data is clocked using any one of four programmable clock phase and polarity combinations.

The CPOL ([SPI_TCR\[1\]](#)) defines the polarity of the clock signal (SPI_SCLK). The SPI_SCLK is a high level when CPOL is '1' and it is a low level when CPOL is '0'. The CPHA ([SPI_TCR\[0\]](#)) decides whether the leading edge of SPI_SCLK is used to setup or sample data. The leading edge is used to setup data when CPHA is '1', and sample data when CPHA is '0'. The following table lists the four modes.

Table 9-9 SPI Transmit Format

Mode	Polarity (CPOL)	Phase (CPHA)	Leading Edge	Trailing Edge
Mode0	0	0	Sample on the rising edge	Setup on the falling edge

Mode	Polarity (CPOL)	Phase (CPHA)	Leading Edge	Trailing Edge
Mode1	0	1	Setup on the rising edge	Sample on the falling edge
Mode2	1	0	Sample on the falling edge	Setup on the rising edge
Mode3	1	1	Setup on the falling edge	Sample on the rising edge

Figure 9-22 and Figure 9-23 describe four waveforms for SPI_SCLK.

9.3.3.5 SPI Master and Slave Mode

The SPI controller can be configured to a master or slave device. The master mode is selected by setting the MODE bit ([SPI_GCR\[1\]](#)); the slave mode is selected by clearing the MODE bit.

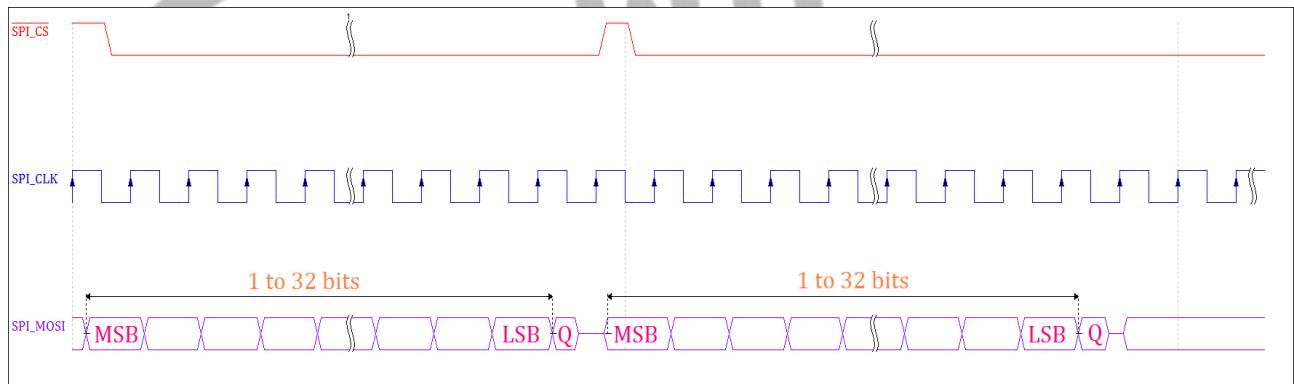

In master mode, the SPI_CLK is generated and transmitted to the external device, and the data from the TX FIFO is transmitted on the MOSI pin, the data from the slave device is received on the MISO pin and sent to RX FIFO. The Chip Select (SPI_SS) is an active low signal, and it must be set low before the data are transmitted or received. The SPI_SS can be selected the auto control mode or software manual control mode. When using the auto control, the SS_OWNER ([SPI_TCR\[6\]](#)) must be cleared (default value is 0); when using the manual control, the SS_OWNER must be set. And the level of SPI_SS is controlled by SS_LEVEL ([SPI_TCR\[7\]](#)).

In slave mode, after the software selects the MODE bit ([SPI_GCR\[1\]](#)) to '0', it waits for master initiate a transaction. When the master asserts SPI_SS, then SPI_CLK is transmitted to the slave device, the slave data is transmitted from TX FIFO on the MISO pin and the data from the MOSI pin is received in RX FIFO.

9.3.3.6 SPI 3-Wire Mode

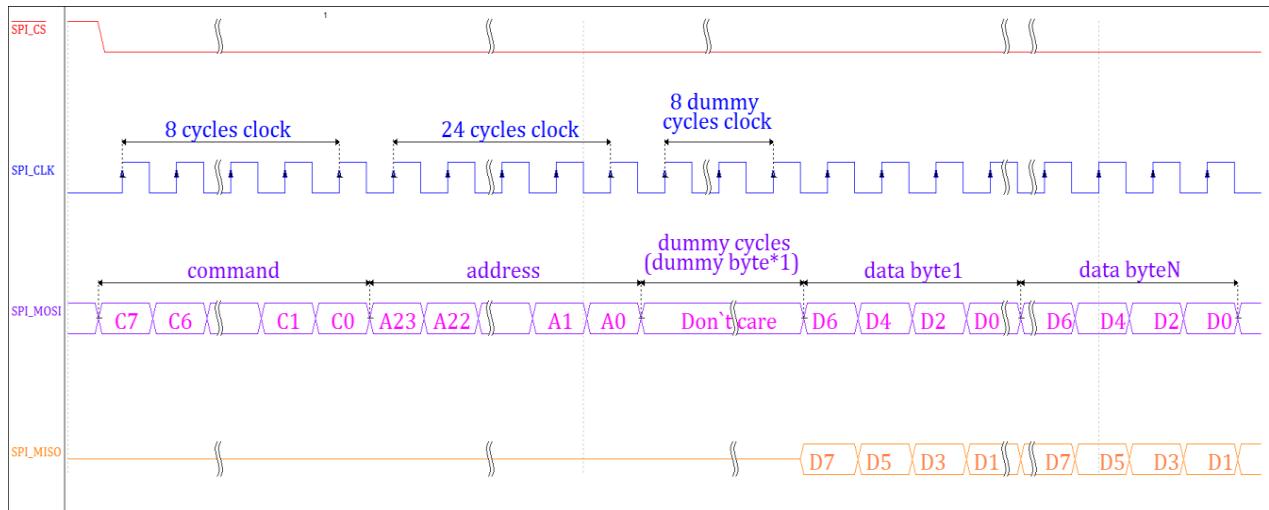

The SPI 3-wire mode is only valid when the SPI controller work in master mode, and is selected when the Work Mode Select bit ([SPI_BATC\[1:0\]](#)) is equal to 0x2. And in the 3-wire mode, the input data and the output data use the same single data line. The following figure describes the 3-wire mode.

Figure 9-24 SPI 3-Wire Mode

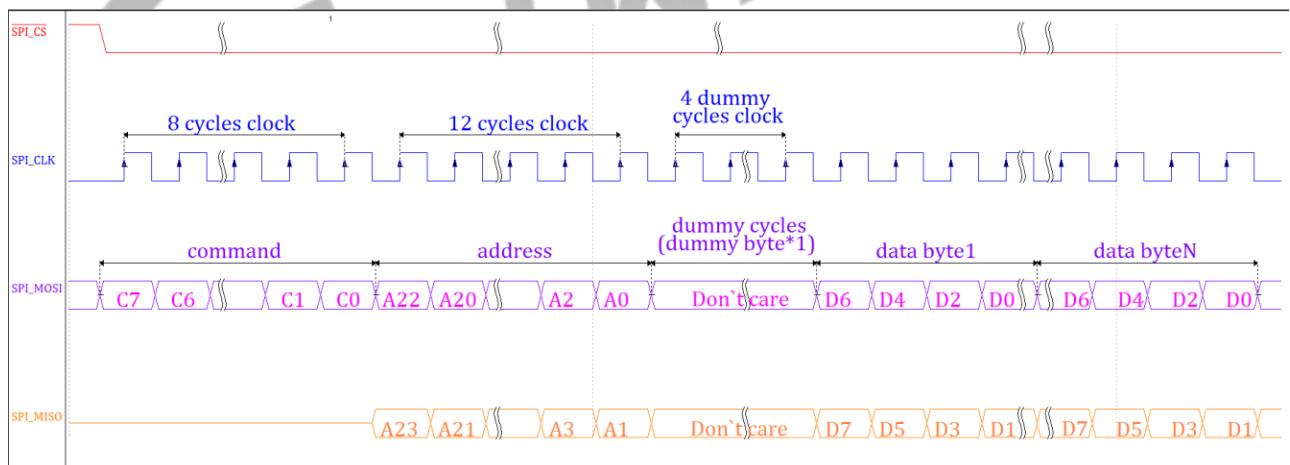

9.3.3.7 SPI Dual-Input/Dual-Output and Dual I/O Mode

The dual read mode (SPI x2) is selected when the DRM is set in [SPI_BCC\[28\]](#). Using the dual mode allows data to be transferred to or from the device at double the rate of standard single mode, the data can be read at fast speed using two data bits (MOSI and MISO) at a time. The following figure describes the dual-input/dual-output SPI (Figure 9-25) and the dual I/O SPI (Figure 9-26).

Figure 9-25 SPI Dual-Input/Dual-Output Mode

In the dual-input/dual-output SPI mode, the command, address, and the dummy bytes output in a unit of a single bit in serial mode through the SPI_MOSI line, only the data bytes are output (write) and input (read) in a unit of dual bits through the SPI_MOSI and SPI_MISO.

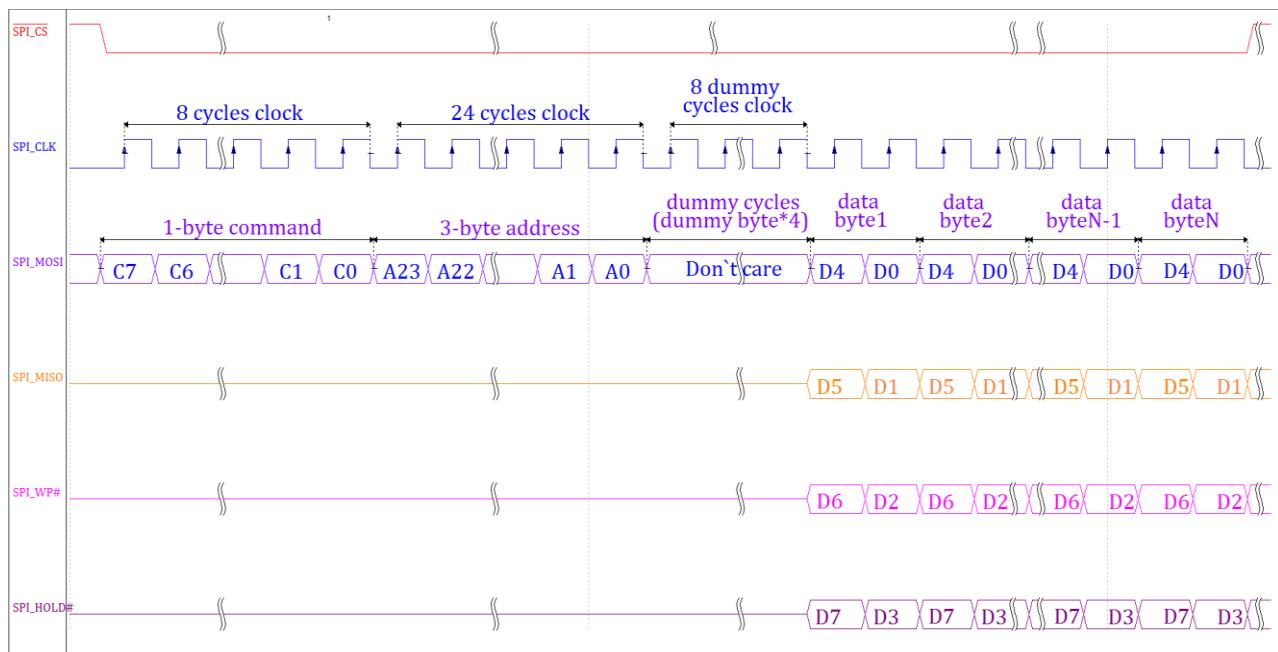

Figure 9-26 SPI Dual I/O Mode

In the dual I/O SPI mode, only the command bytes output in a unit of a single bit in serial mode through the SPI_MOSI line. The address bytes and the dummy bytes output in a unit of dual bits through the SPI_MOSI and SPI_MISO. And the data bytes output (write) and input (read) in a unit of dual bits through the SPI_MOSI and SPI_MISO.

9.3.3.8 SPI Quad-Input/Quad-Output Mode

The quad read mode (SPI x4) is selected when the Quad_EN is set in [SPI_BCC](#)[29]. Using the quad mode allows data to be transferred to or from the device at 4 times the rate of standard single mode, the data can be read at fast speed using four data bits (MOSI, MISO, IO2 (WP#) and IO3 (HOLD#)) at the same time. The following figure describes the quad-input/quad-output SPI.

Figure 9-27 SPI Quad-Input/Quad-Output Mode

In the quad-input/quad-output SPI mode, the command, address, and the dummy bytes output in a unit of a single bit in serial mode through SPI_MOSI line. Only the data bytes output (write) and input (read) in a unit of quad bits through the SPI_MOSI, SPI_MISO, SPI_WP#, and SPI_HOLD#.

9.3.3.9 Transmission/Reception Bursts in Master Mode

In SPI master mode, the transmission and reception bursts (byte in unit) are configured before the SPI transfers the serial data between the processor and external device. The transmission bursts are written in MWTC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). The transmission bursts in single mode before automatically sending dummy bursts are written in STC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). For dummy data, the SPI controller can automatically send before receiving by writing DBC (bit[27:24]) in the [SPI Master Transmit Counter Register](#). If users do not use the SPI controller to send dummy data automatically, then the dummy bursts are used as the transmission counters to write together in MWTC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). In master mode, the total burst numbers are written in MBC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). When all transmission and reception bursts are transferred, the SPI controller will send a completed interrupt, at the same time, the SPI controller will clear [DBC](#), [MWTC](#), and [MBC](#).

9.3.3.10 SPI Sample Mode and Run Clock Configuration

The SPI controller runs at 3 kHz–100 MHz at its interface to external SPI devices. The internal SPI clock should run at the same frequency as the outgoing clock in the master mode. The SPI clock is selected from different clock sources, the SPI must configure different work mode. There are three work modes: normal sample mode, delay half-cycle sample mode, delay one-cycle sample mode. The Delay half-cycle sample mode is the default mode of the SPI controller. When the SPI runs at 40 MHz or below 40 MHz, the SPI can work at normal sample mode or delay half-cycle sample mode. When the SPI runs over 80 MHz, setting the SDC bit in the [SPI Transfer Control Register](#) to '1' makes the internal read sample point with a half-cycle delay of SPI_CLK, which is used in high speed read operation to reduce the error caused by the time delay of SPI_CLK between master and slave. Table 9-10 and Table 9-11 show the different configurations of the SPI sample mode.

Table 9-10 SPI Old Sample Mode and Run Clock

SPI Sample Mode	SDM(bit13)	SDC(bit11)	Run Clock
normal sample	1	0	<=24 MHz
delay half cycle sample	0	0	<=40 MHz
delay one cycle sample	0	1	>=80 MHz

The remaining spectrum is not recommended. Because when the output delay of SPI flash (refer to the datasheet of the manufacturer for the specific delay time) is the same with the half-cycle time of SPI working clock, the variable edge of the output data for the device bumps into the clock sampling edge of the controller, so setting 1 cycle of sampling delay would cause stability problem.

Table 9-11 SPI New Sample Mode

SPI Sample Mode	SDM (bit13)	SDC (bit11)	SDC1 (bit15)
normal sample	1	0	0
delay half cycle sample	0	0	0
delay one cycle sample	0	1	0
delay 1.5 cycle sample	1	1	0
delay 2 cycle sample	1	0	1
delay 2.5 cycle sample	0	0	1
delay 3 cycle sample	0	1	1

9.3.3.11 SPI Error Conditions

If any error conditions occur, the hardware will set the corresponding status bits in the [SPI Interrupt Status Register](#) and stop the transfer. For the SPI controller, the following error scenarios can happen.

1. TX_FIFO Underrun

The TX_FIFO underrun happens when the CPU/DMA reads data from TX FIFO when it is empty. In the case, the SPI controller will end the transaction and flag the error bit along with the TF_UDF bit in the [SPI Interrupt Status Register](#). The SPI controller will generate an interrupt if interrupts are enabled. The software has to clear the error bit and the TF_UDF bit. To start a new transaction, the software has to reset the FIFO by writing to the SRST (soft reset) bit in the [SPI Global Control Register](#).

2. TX_FIFO Overflow

The TX_FIFO overflow happens when the CPU/DMA writes data into the TX FIFO when it is full. In the case, the SPI controller will end the transaction and flag the error bit along with the TF_OVF bit in the [SPI Interrupt Status Register](#). The SPI controller will generate an interrupt if interrupts are enabled. The software has to clear the error bit and the TF_OVF bit. To start a new transaction, the software has to reset the FIFO by writing to the SRST (soft reset) bit in the [SPI Global Control Register](#).

3. RX_FIFO Underrun

The RX_FIFO underrun happens when the CPU/DMA reads data from RX FIFO when it is empty. In the case, the SPI controller will end the transaction and flag the error bit along with the RF_UDF bit in the [SPI Interrupt Status Register](#). The SPI controller will generate an interrupt if interrupts are enabled. The software has to clear the error bit and the RF_UDF bit. To start a new transaction, the software has to reset the fifo by writing to the SRST (soft reset) bit in the [SPI Global Control Register](#).

4. RX_FIFO Overflow

The RX_FIFO overflow happens when the CPU/DMA writes data into the RX FIFO when it is full. In the case, the SPI controller will end the transaction and flag the error bit along with the RF_OVF bit in the [SPI Interrupt Status Register](#). The SPI controller will generate an interrupt if interrupts are enabled. The software has to clear the error bit and the RF_OVF bit. To start a new transaction, the software has to reset the FIFO by writing to the SRST (soft reset) bit in the [SPI Global Control Register](#).

9.3.4 Programming Guidelines

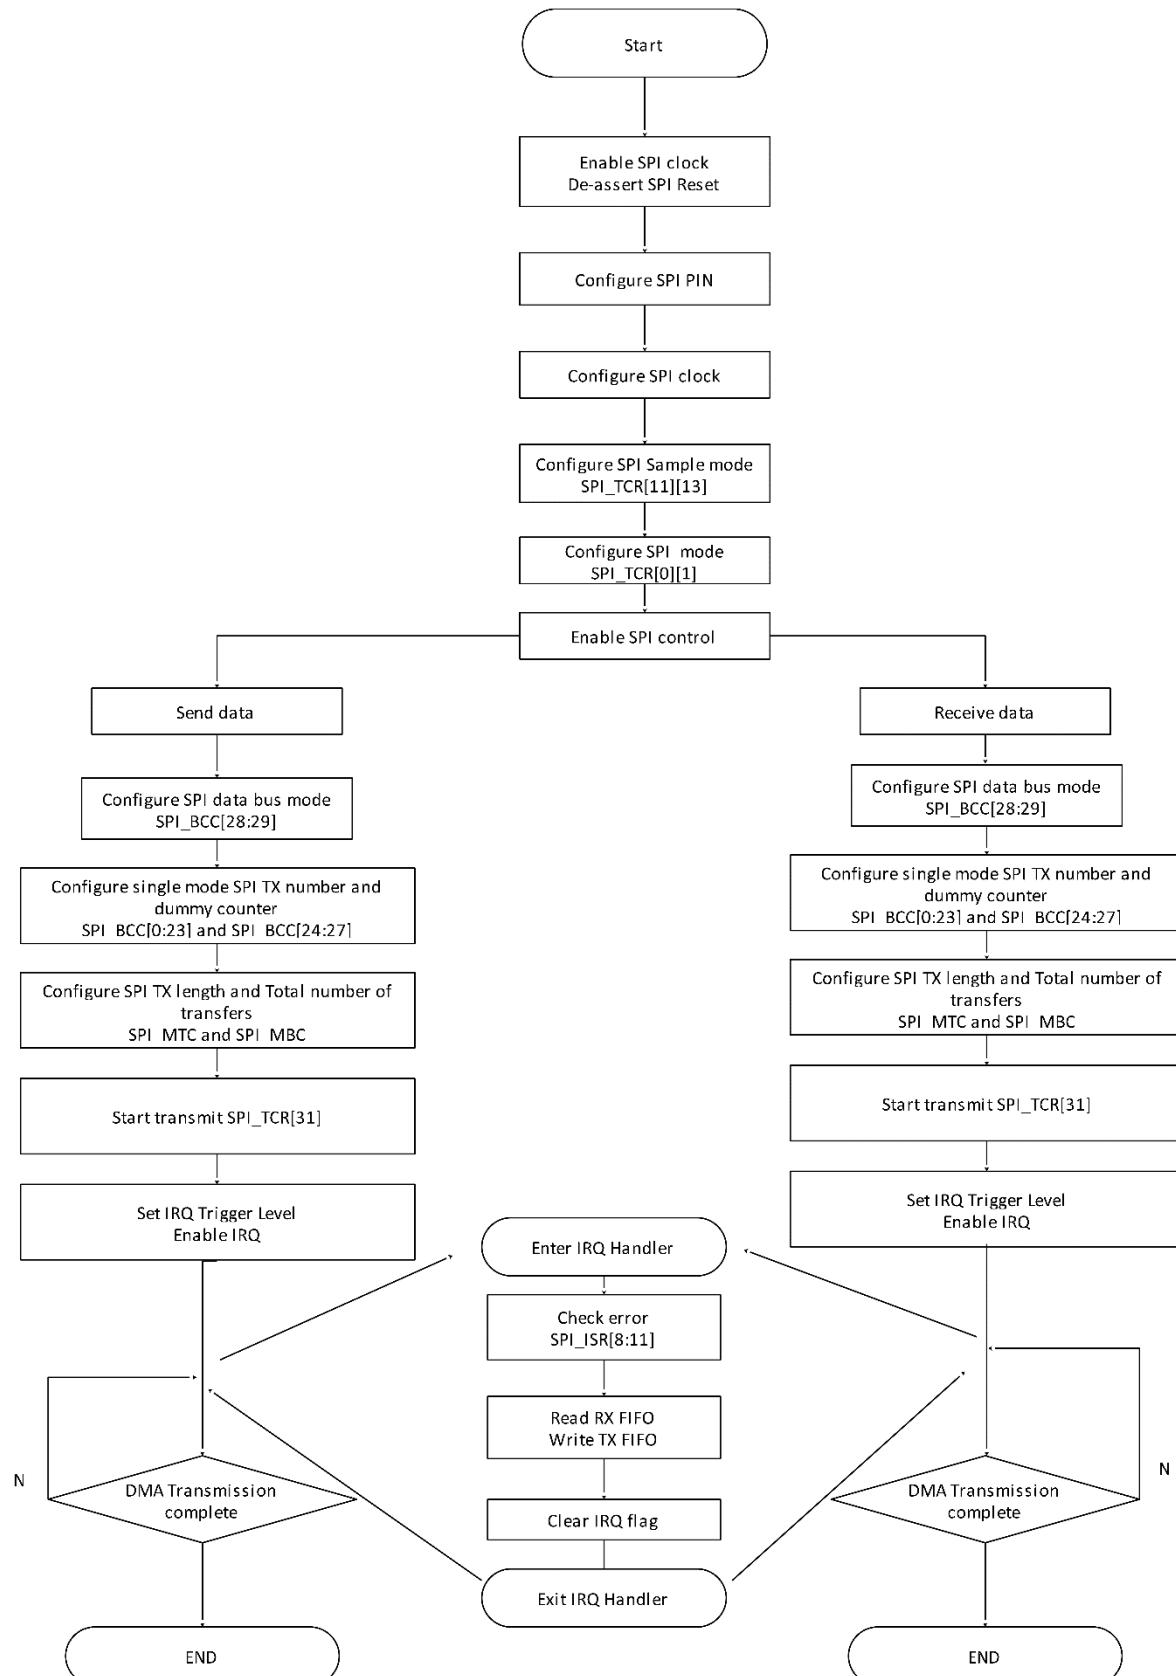

9.3.4.1 Writing/Reading Data Process

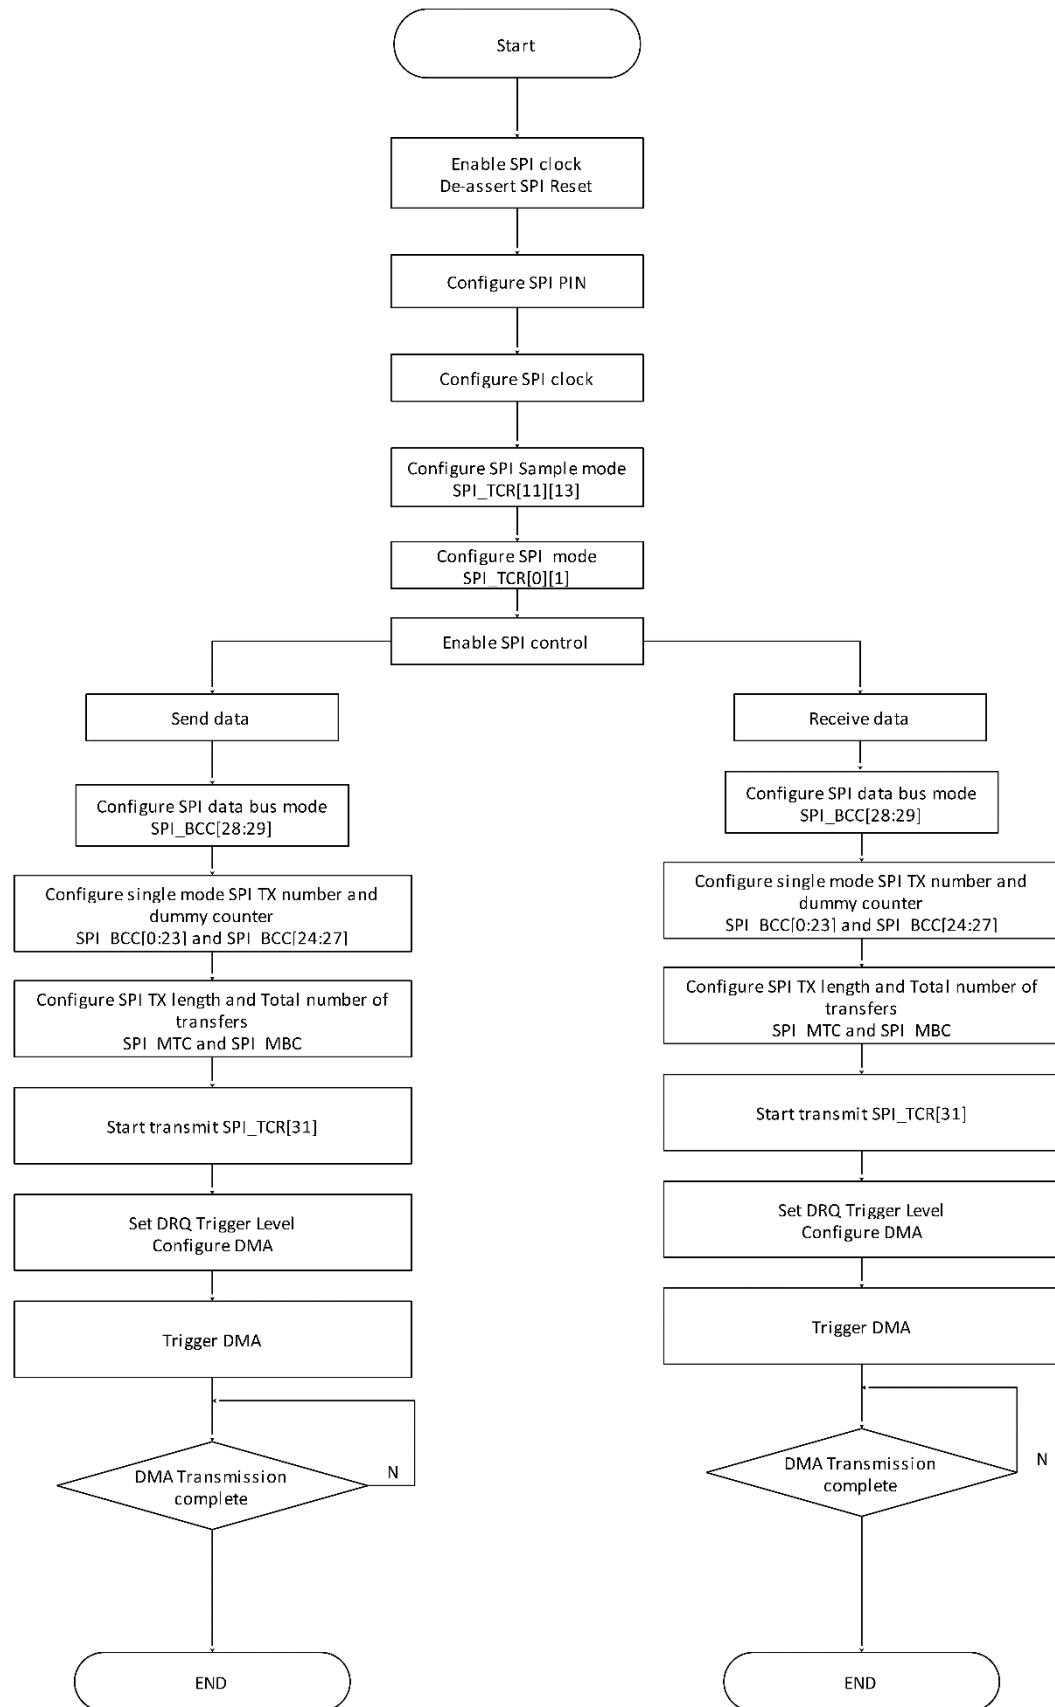

The SPI transfers serial data between the processor and the external device. The CPU mode and DMA mode are the two main operational modes for SPI. For each SPI, the data is simultaneously transmitted (shifted out serially) and received (shifted in serially). The SPI has 2 channels, including the TX channel and RX channel. The TX channel has the path from TX FIFO to the external device. The RX channel has the path from the external device to RX FIFO.

Write Data: The CPU or DMA must write data on the [SPI_TXD](#) register, the data on the register are automatically moved to TX FIFO.

Read Data: To read data from RX FIFO, the CPU or DMA must access the [SPI_RXD](#) register and the data are automatically sent to the [SPI_RXD](#) register.

In CPU or DMA mode, the SPI sends a completed interrupt ([SPI_ISR\[TC\]](#)) to the processor after each transmission is complete.

9.3.4.2 Calibrate Delay Chain

The SPI has one delay chain which is used to generate delay to make proper timing between the internal SPI clock signal and data signals. Delay chain is made up of 64 delay cells. The delay time of one delay cell can be estimated through delay chain calibration.

The steps to calibrate delay chain are as follows:

- Step 1** Enable SPI. To calibrate the delay chain by the operation registers in SPI, the SPI must be enabled through AHB reset and AHB clock gating control registers.
- Step 2** Configure a proper clock for SPI. The calibration delay chain is based on the clock for SPI from CCU.
- Step 3** Set proper initial delay value. Write 0xA0 to the [SPI Sample Delay Control Register](#) to set initial delay value 0x20 to delay chain. Then write 0x0 to the [SPI Sample Delay Control Register](#) to clear this value.
- Step 4** Write 0x8000 to the [SPI Sample Delay Control Register](#) to start to calibrate the delay chain.
- Step 5** Wait until the flag (bit14 in the [SPI Sample Delay Control Register](#)) of calibration done is set. The number of delay cells is shown at the bit[13:8] of the [SPI Sample Delay Control Register](#). The delay time generated by these delay cells is equal to the cycle of the SPI clock nearly. This value is the result of calibration.
- Step 6** Calculate the delay time of one delay cell according to the cycle of the SPI clock and the result of calibration.

9.4 SPI_DBI

9.4.1 Overview

The T113-S3 provides a 3/4 line SPI display bus interface (SPI_DBI) for video data transmission. It supports DBI mode or SPI mode. The DBI mode is compatible with multiple video data formats at the same time. The SPI mode is used for low-cost display schemes.

The SPI mode has the following features:

- Full-duplex synchronous serial interface
- Master/slave configurable
- 8-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SPI_SS) and SPI Clock (SPI_SCLK) are configurable
- Supports interrupts and DMA
- Supports mode0, mode1, mode2, and mode3
- Supports 3-wire/4-wire SPI
- Supports programmable serial data frame length: 1 bit to 32 bits
- Supports standard SPI, dual-output/dual-input SPI, dual I/O SPI, quad-output/quad-input SPI
- Supports maximum IO rate of the mass production: 100 MHz

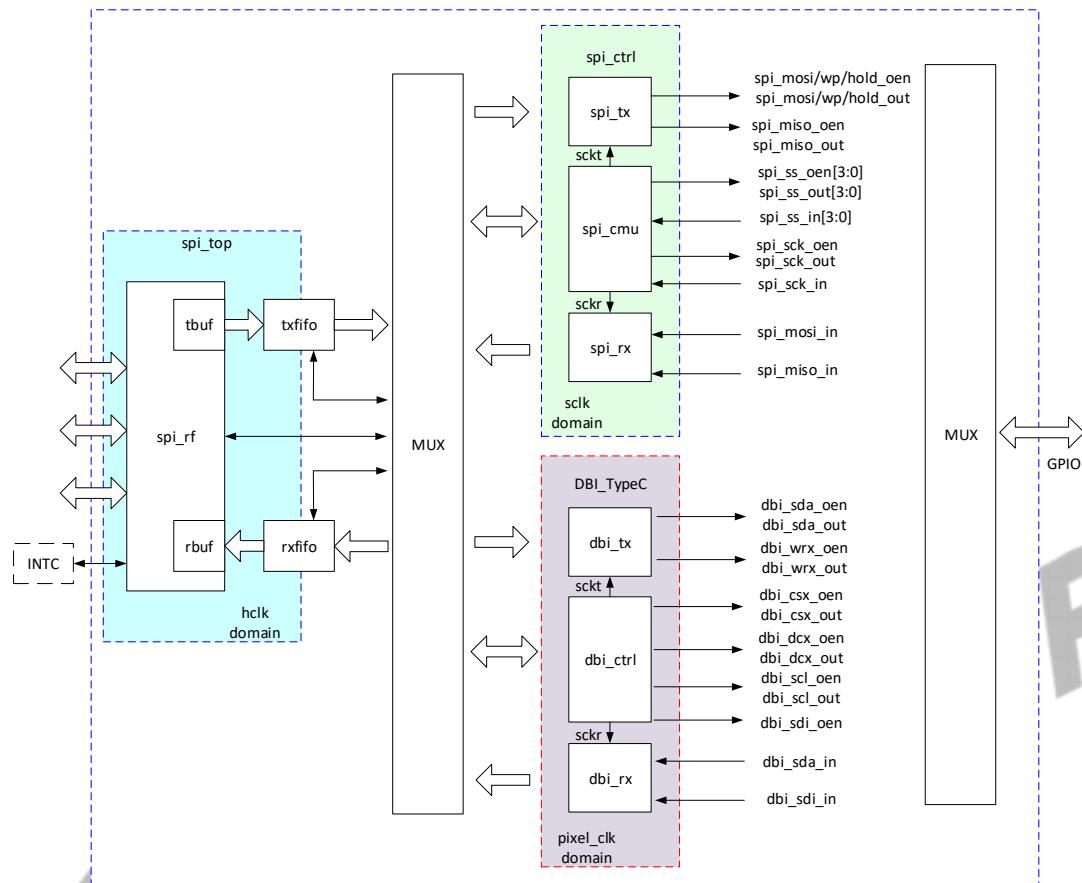

The DBI mode has the following features:

- Supports DBI Type C 3 Line/4 Line Interface Mode
- Supports 2 Data Lane Interface Mode
- Supports data source from CPU or DMA
- Supports RGB111/444/565/666/888 video format
- Maximum resolution of RGB666 240 x 320@30Hz with single data lane
- Maximum resolution of RGB888 240 x 320@60Hz or 320 x 480@30Hz with dual data lane
- Supports Tearing effect
- Supports software flexible control video frame rate

9.4.2 Block Diagram

Figure 9-30 shows a block diagram of the SPI_DBI.

Figure 9-30 SPI_DBI Block Diagram

SPI_DBI contains the following sub-blocks:

Table 9-12 SPI_DBI Sub-blocks

Sub-block	Description
spi_rf	Responsible for implementing the internal register, interrupt, and DMA Request.
spi_tbuf	The data length transmitted from AHB to TXFIFO is converted into 8 bits, then the data is written into the RXFIFO.
spi_rbuf	The block is used to convert the RXFIFO data into the reading data length of AHB.
txfifo, rxfifo	The data transmitted from the SPI to the external serial device is written into the TXFIFO; the data received from the external serial device into SPI is pushed into the RXFIFO.
spi_cmu	Responsible for implementing SPI bus clock, chip select, internal sample, and the generation of transfer clock.
spi_tx	Responsible for implementing SPI data transfer, the interface of the internal TXFIFO, and status register.

Sub-block	Description
spi_rx	Responsible for implementing SPI data receive, the interface of the internal RXFIFO, and status register.
dbi_ctrl	Responsible for implementing DBI bus clock, chip select, data command select, RGB format reshape.
dbi_tx	Responsible for implementing DBI data transfer, the interface of the internal TXFIFO, and status register.
dbi_rx	Responsible for implementing DBI data receive, the interface of the internal RXFIFO, and status register.

9.4.3 Functional Description

9.4.3.1 External Signals

The following table describes the external signals of SPI_DBI. When using SPI_DBI, the corresponding PADs are selected as SPI_DBI function via section 9.7 “[GPIO](#)”.

Table 9-13 SPI_DBI External Signals

External Signal	Description	Type
DBI Mode	DBI-CSX	Chip select signal, low active
	DBI-SCLK	Serial clock signal
	DBI-SDO	Data output signal
	DBI-SDI	Data input signal, the data is sampled on the rising edge and the falling edge
	DBI-TE	Tearing effect input, it is used to capture the external TE signal edge.
	DBI-DCX	DCX pin is the select output signal of data and command. DCX = 0: register command; DCX = 1: data or parameter.
	DBI-WRX	When DBI operates in dual data lane format, the RGB666 format 2 can use WRX to transfer data
SPI Mode	SPI1-CS	SPI1 chip select signal, low active When the device is not selected, data will not be accepted via the SI pin, and the SO pin will stop transmission.
	SPI1-CLK	SPI1 clock signal This pin is used to provide a clock to the device and is used to control the flow of data to and from the device.
	SPI1-MOSI	SPI1 master data out, slave data in

External Signal	Description	Type
SPI1-MISO	SPI1 master data in, slave data out	I/O
SPI1-WP	Write protection and active low It also can be used for serial data input and output for SPI Quad Input or Quad Output mode.	I/O
SPI1-HOLD	When the device is selected and a serial sequence is underway, the HOLD pin is can be used to temporarily pause the serial communication with the master device without deselecting or resetting the device serial sequence. While the HOLD pin is asserted, the SO pin is at high impedance, and all transitions on the SCK pin and data on the SI pin are ignored. It also can be used for serial data input and output for SPI Quad Input or Quad Output mode.	I/O

9.4.3.2 Clock Sources

The SPI_DBI controller gets 5 different clock sources, users can select one of them to make SPI_DBI clock source. The following table describes the clock sources for SPI_DBI. For more details on the clock setting, configuration, and gating information, see section 3.3 “[CCU](#)”.

Table 9-14 SPI_DBI Clock Sources

Clock Sources	Description
HOSC	24 MHz Crystal
PLL_PERI(1X)	Peripheral Clock, the default value is 600 MHz
PLL_PERI(2X)	Peripheral Clock, the default value is 1200 MHz
PLL_AUDIO0(DIV2)	Audio Clock, the default value is 1536 MHz
PLL_AUDIO0(DIV5)	Audio Clock, the default value is 614.4 MHz

9.4.3.3 Typical Application

Figure 9-31 shows the application block diagram when the SPI master device is connected to a slave device.

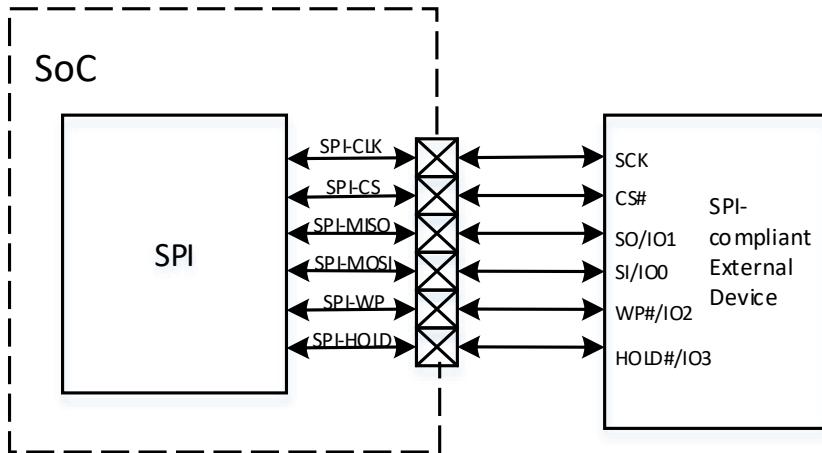

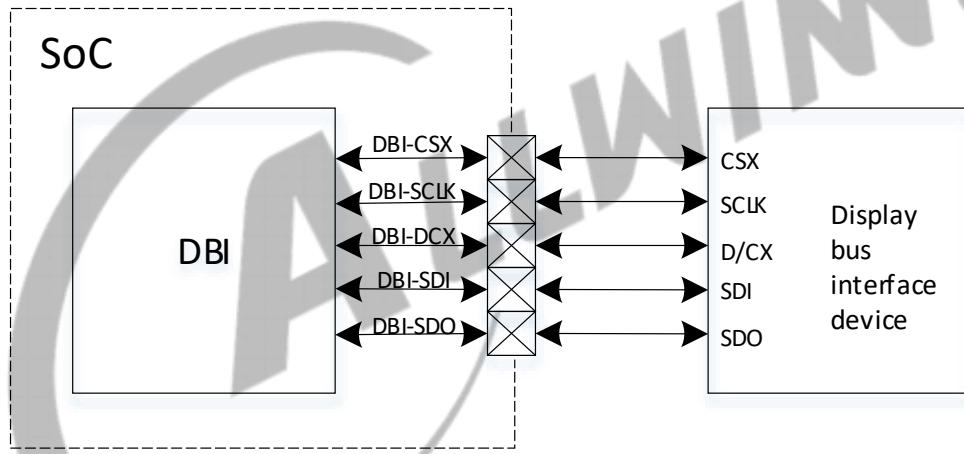

Figure 9-31 SPI Application Block Diagram

Figure 9-32 shows the application block diagram when the DBI master device is connected to a display bus interface device.

Figure 9-32 DBI Application Block Diagram

9.4.3.4 SPI Transmission Format

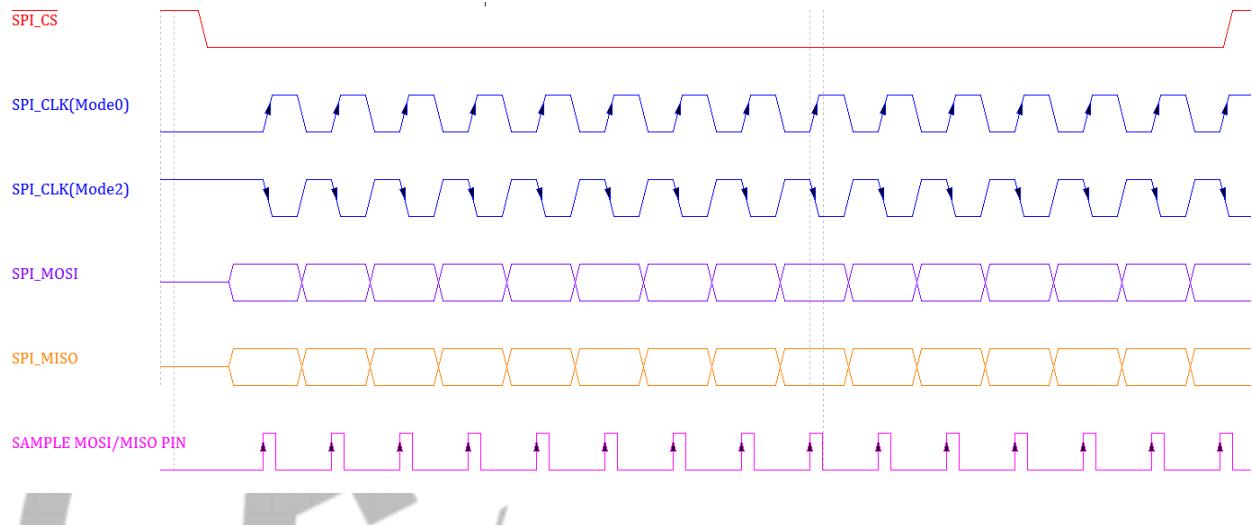

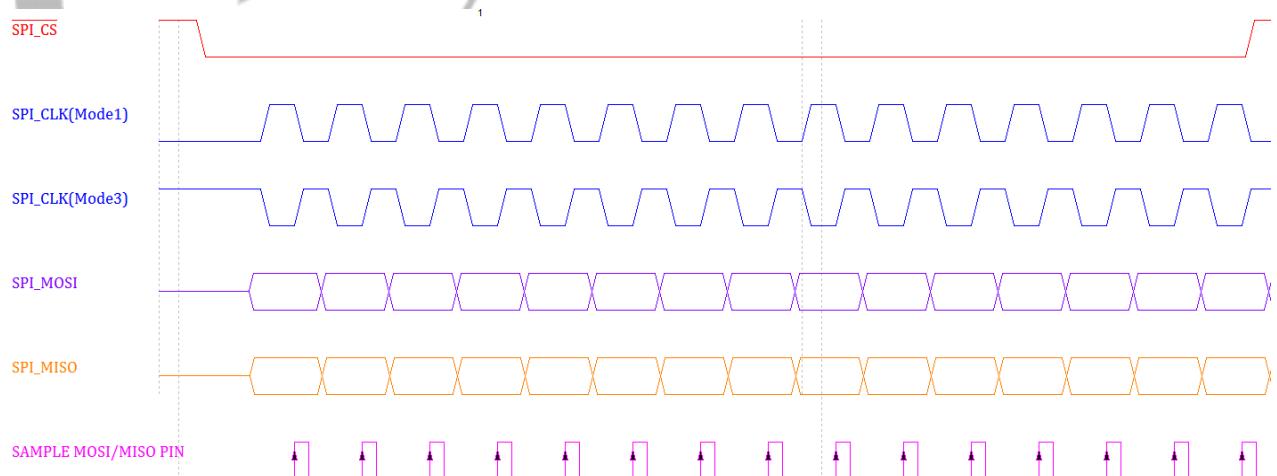

The SPI supports 4 different formats for data transmission. The software can select one of the four modes in which the SPI works by setting the bit1 (Polarity) and bit0 (Phase) of [SPI_TCR](#). The SPI controller master uses the SPI_SCLK signal to transfer data in and out of the shift register. Data is clocked using any one of four programmable clock phase and polarity combinations.

The CPOL ([SPI_TCR\[1\]](#)) defines the polarity of the clock signal (SPI_SCLK). The SPI_SCLK is a high level when CPOL is '1' and it is a low level when CPOL is '0'. The CPHA ([SPI_TCR\[0\]](#)) decides whether the leading edge of SPI_SCLK is used to setup or sample data. The leading edge is used to setup data when CPHA is '1', and sample data when CPHA is '0'. The following table lists the four modes.

Table 9-15 SPI Transmit Format

SPI Mode	Polarity (CPOL)	Phase (CPHA)	Leading Edge	Trailing Edge
mode0	0	0	Sample on the rising edge	Setup on the falling edge
mode1	0	1	Setup on the rising edge	Sample on the falling edge
mode2	1	0	Sample on the falling edge	Setup on the rising edge
mode3	1	1	Setup on the falling edge	Sample on the rising edge

Figure 9-33 and Figure 9-34 describe four waveforms for SPI_SCLK.

Figure 9-33 SPI Phase 0 Timing Diagram**Figure 9-34 SPI Phase 1 Timing Diagram**

9.4.3.5 SPI Master and Slave Mode

The SPI controller can be configured to a master or slave device. The master mode is selected by setting the MODE bit ([SPI_GCR\[1\]](#)); the slave mode is selected by clearing the MODE bit.

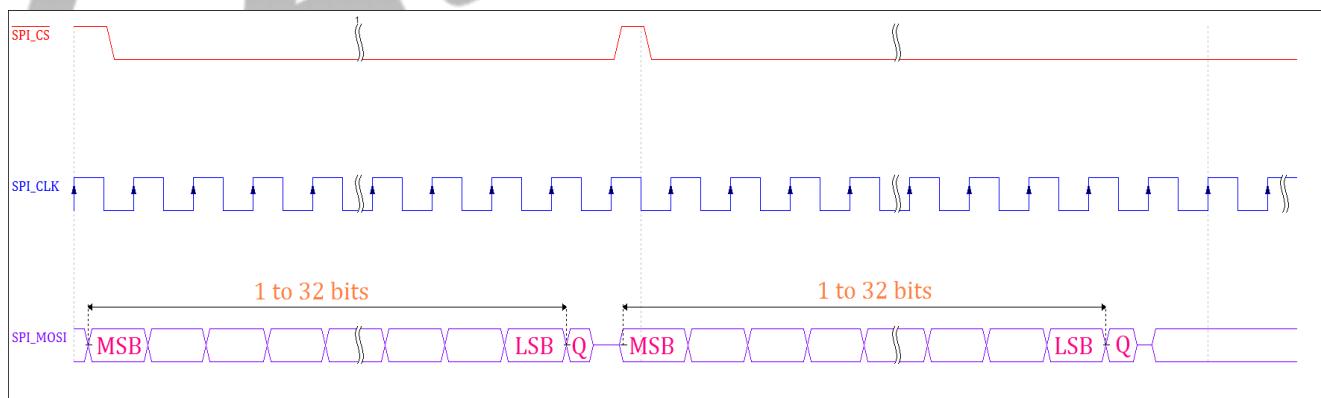

In master mode, the SPI_CLK is generated and transmitted to the external device, and the data from the TX FIFO is transmitted on the MOSI pin, the data from the slave is received on the MISO pin and sent to RX FIFO. The Chip Select (SPI_SS) is an active low signal, and it must be set low before the data are transmitted or received. The SPI_SS can be selected the auto control mode or the software manual control mode. When using auto control, the SS_OWNER ([SPI_TCR\[6\]](#)) must be cleared (default value is 0); when using manual control, the SS_OWNER must be set. And the level of SPI_SS is controlled by SS_LEVEL ([SPI_TCR\[7\]](#)).

In slave mode, after the software selects the MODE bit ([SPI_GCR\[1\]](#)) to '0', it waits for master initiate a transaction. When the master asserts SPI_SS, and SPI_CLK is transmitted to the slave, the slave data is transmitted from TX FIFO on the MISO pin, and the data from the MOSI pin is received in RX FIFO.

9.4.3.6 SPI 3-Wire Mode

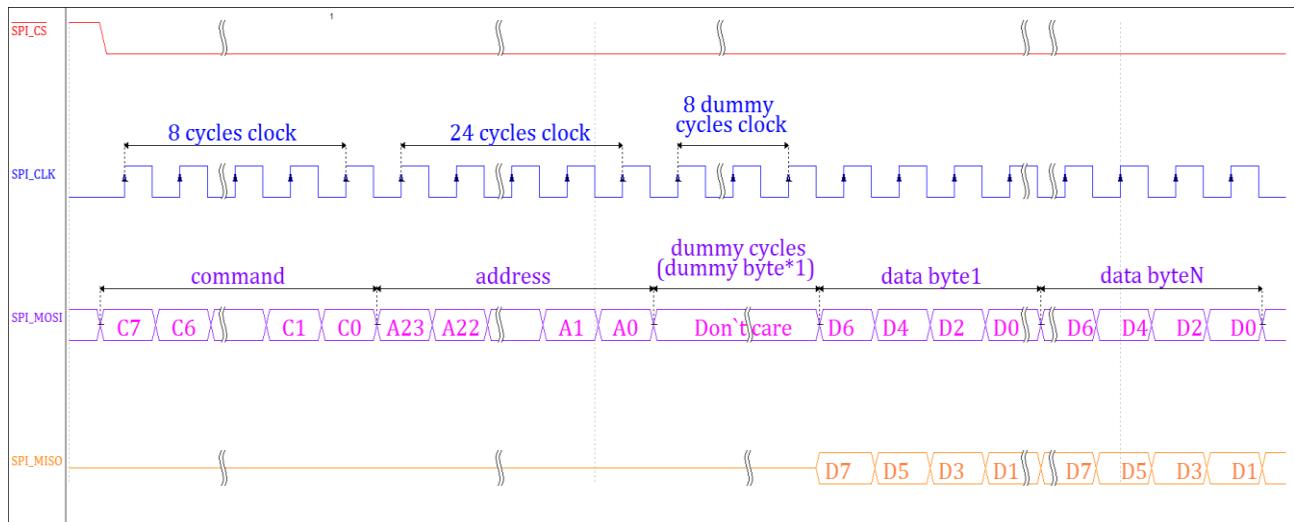

The SPI 3-wire mode is only valid when the SPI controller work in master mode, and is selected when the Work Mode Select bit ([SPI_BATC\[1:0\]](#)) is equal to 0x2. And in the 3-wire mode, the input data and the output data use the same single data line. The following figure describes the 3-wire mode.

Figure 9-35 SPI 3-Wire Mode

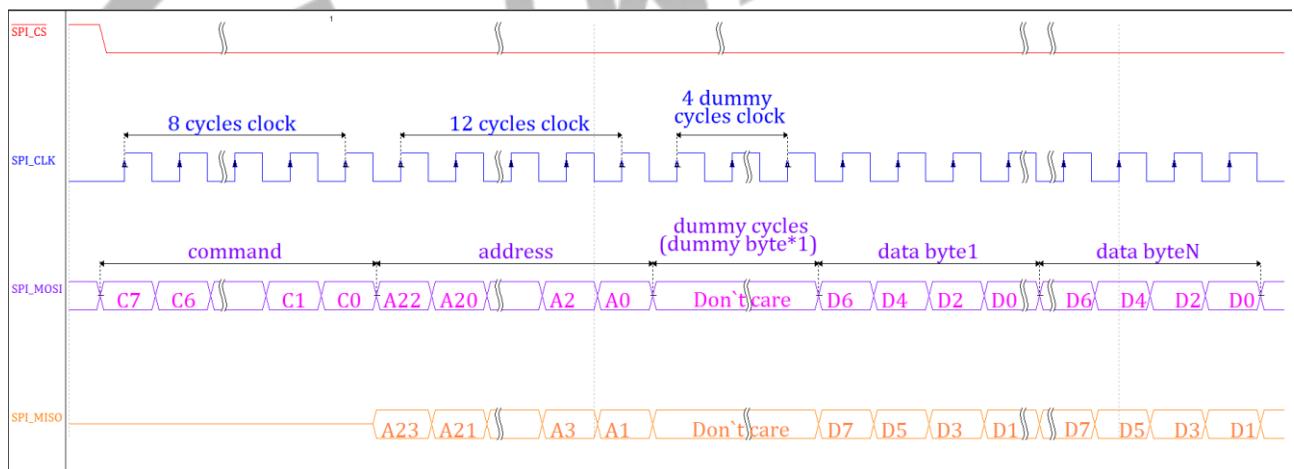

9.4.3.7 SPI Dual-Input/Dual-Output and Dual I/O Mode

The dual read mode (SPI x2) is selected when the DRM is set in [SPI_BCC\[28\]](#). Using the dual mode allows data to be transferred to or from the device at double the rate of standard single mode SPI devices, the data can be read at fast speed using two data bits (MOSI and MISO) at a time. The following figure describes the dual-input/dual-output SPI (Figure 9-36) and the dual I/O SPI (Figure 9-37).

Figure 9-36 SPI Dual-Input/Dual-Output Mode

In the dual-input/dual-output SPI mode, the command, address, and the dummy bytes output in a unit of a single bit in serial mode through the SPI_MOSI line, only the data bytes are output (write) and input (read) in a unit of dual bits through the SPI_MOSI and SPI_MISO.

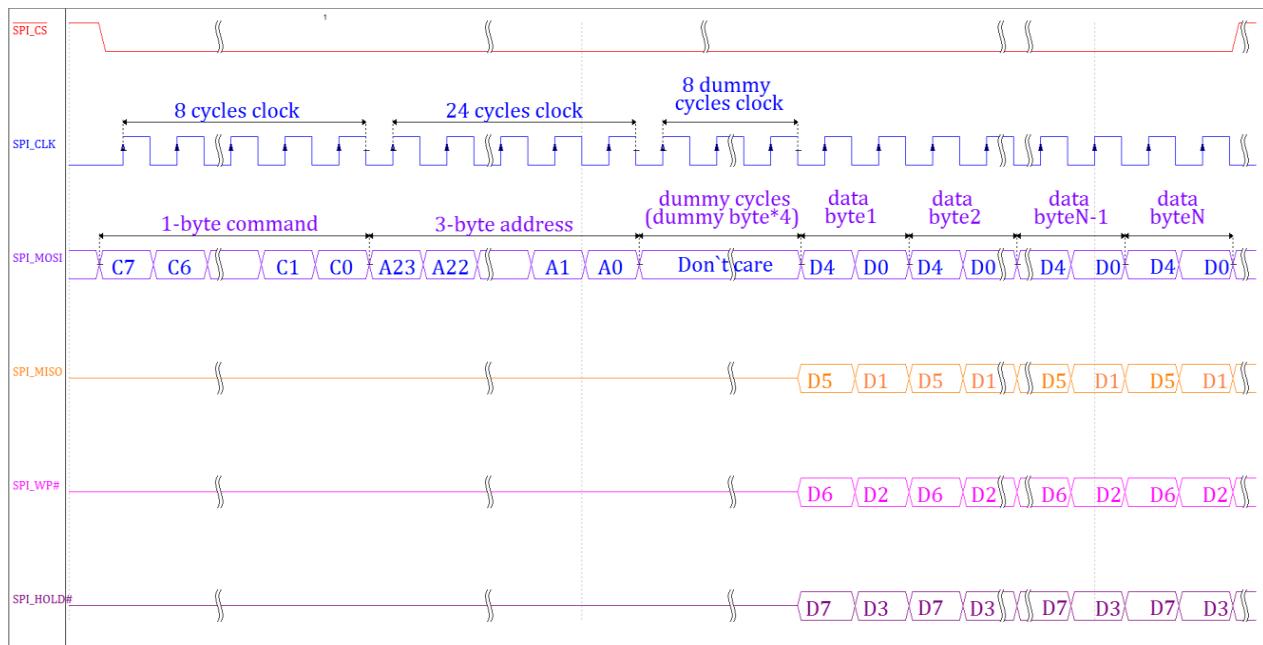

Figure 9-37 SPI Dual I/O Mode

In the dual I/O SPI mode, only the command bytes output in a unit of a single bit in serial mode through the SPI_MOSI line. The address bytes and the dummy bytes output in a unit of dual bits through the SPI_MOSI and SPI_MISO. And the data bytes output (write) and input (read) in a unit of dual bits through the SPI_MOSI and SPI_MISO.

9.4.3.8 SPI Quad-Input/Quad-Output Mode

The quad read mode (SPI x4) is selected when the Quad_EN is set in [SPI_BCC\[29\]](#). Using the quad mode allows data to be transferred to or from the device at 4 times the rate of standard single mode SPI devices, the data can be read at fast speed using four data bits (MOSI, MISO, IO2 (WP#) and IO3 (HOLD#)) at the same time. The following figure describes the quad-input/quad-output SPI.

Figure 9-38 SPI Quad-Input/Quad-Output Mode

In the quad-input/quad-output SPI mode, the command, address, and the dummy bytes output in a unit of a single bit in serial mode through the SPI_MOSI line. Only the data bytes output (write) and input (read) in a unit of quad bits through the SPI_MOSI, SPI_MISO, SPI_WP#, and SPI_HOLD#.

9.4.3.9 Transmission/Reception Bursts in Master Mode

In SPI master mode, the transmission and reception bursts (byte in unit) are configured before the SPI transfers serial data between the processor and external device. The transmission bursts are written in MWTC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). The transmission bursts in single mode before automatically sending dummy bursts are written in STC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). For dummy data, the SPI controller can automatically send before receiving by writing DBC (bit[27:24]) in the [SPI Master Transmit Counter Register](#). If users do not use the SPI controller to send dummy data automatically, then the dummy bursts are used as the transmission counters to write together in MWTC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). In master mode, the total burst numbers are written in MBC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). When all transmission and reception bursts are transferred, the SPI controller will send a completed interrupt, at the same time, the SPI controller will clear DBC, MWTC, and MBC.

9.4.3.10 SPI Sample Mode and Run Clock Configuration

The SPI controller runs at 3 kHz–100 MHz at its interface to external SPI devices. The internal SPI clock should run at the same frequency as the outgoing clock in the master mode. The SPI clock is selected from different clock sources, the SPI must configure different work mode. There are three work modes: normal sample mode, delay half-cycle sample mode, delay one-cycle sample mode. Delay half-cycle sample mode is the default mode of the SPI controller. When the SPI runs at 40 MHz or below 40 MHz, the SPI can work at normal sample mode or delay half-cycle sample mode. When the SPI runs over 80 MHz, setting the SDC bit in the [SPI Transfer Control Register](#) to '1' makes the internal read sample point with a half-cycle delay of SPI_CLK, which is used in high speed read operation to reduce the error caused by the time delay of SPI_CLK between master and slave. Table 9-16 and Table 9-17 show the different configurations of the SPI sample mode.

Table 9-16 SPI Old Sample Mode and Run Clock

SPI Sample Mode	SDM(bit13)	SDC(bit11)	Run Clock
normal sample	1	0	<=24 MHz
delay half cycle sample	0	0	<=40 MHz
delay one cycle sample	0	1	>=80 MHz

The remaining spectrum is not recommended. Because when the output delay of SPI flash (refer to the datasheet of the manufacturer for the specific delay time) is the same with the half-cycle time of SPI working clock, the variable edge of the output data for the device bumps into the clock sampling edge of the controller, so setting 1 cycle of sampling delay would cause stability problem.

Table 9-17 SPI New Sample Mode

SPI Sample Mode	SDM (bit13)	SDC (bit11)	SDC1 (bit15)
normal sample	1	0	0
delay half cycle sample	0	0	0
delay one cycle sample	0	1	0
delay 1.5 cycle sample	1	1	0
delay 2 cycle sample	1	0	1
delay 2.5 cycle sample	0	0	1
delay 3 cycle sample	0	1	1

9.4.3.11 DBI 3-Line Interface Writing and Reading Timing

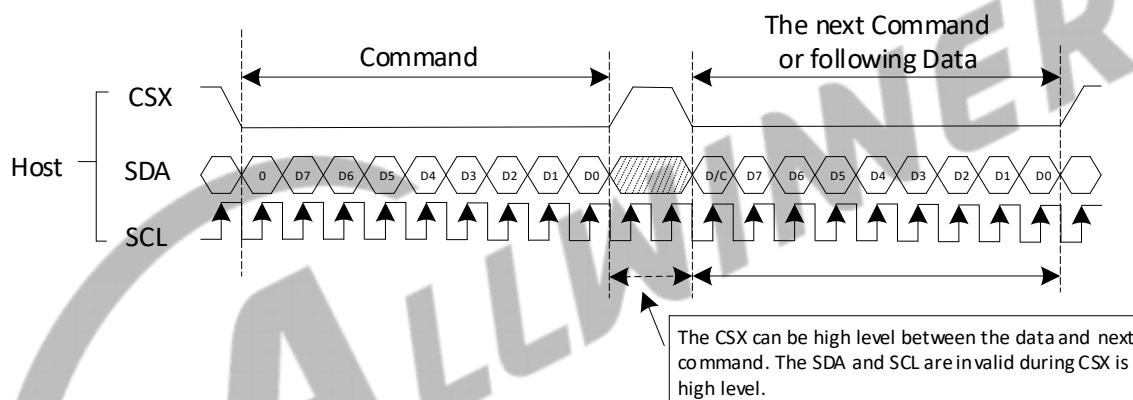

The 3-line DBI Interface I contains CSX, SDA, and SCL, where SDA shares this port for bidirectional port data input and output.

The 3-line DBI Interface II contains CSX, SDA, SCL, and SDI; Data input and output ports are independent of each other.

Since the 3-line display bus mode has no Data/Command data line indicating whether Data or Command is currently being transmitted, an extra bit is added to the data-stream before MSB to indicate whether Data or Command is currently being transmitted. (0: Command, 1: Data)

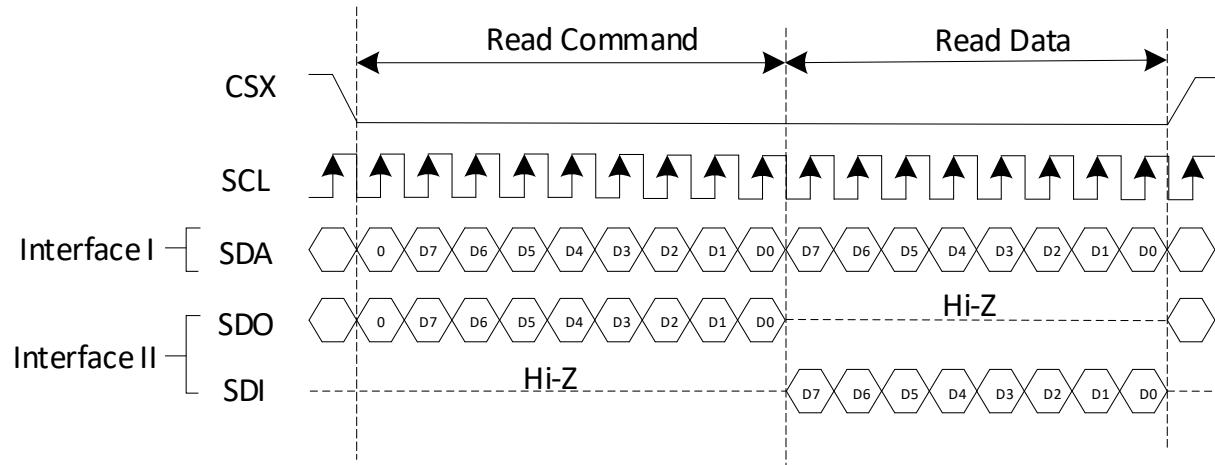

The following figure shows the writing operation format of 3-line DBI Interface I and Interface II.

Figure 9-39 DBI 3-Line Display Bus Serial Interface Writing Operation Format

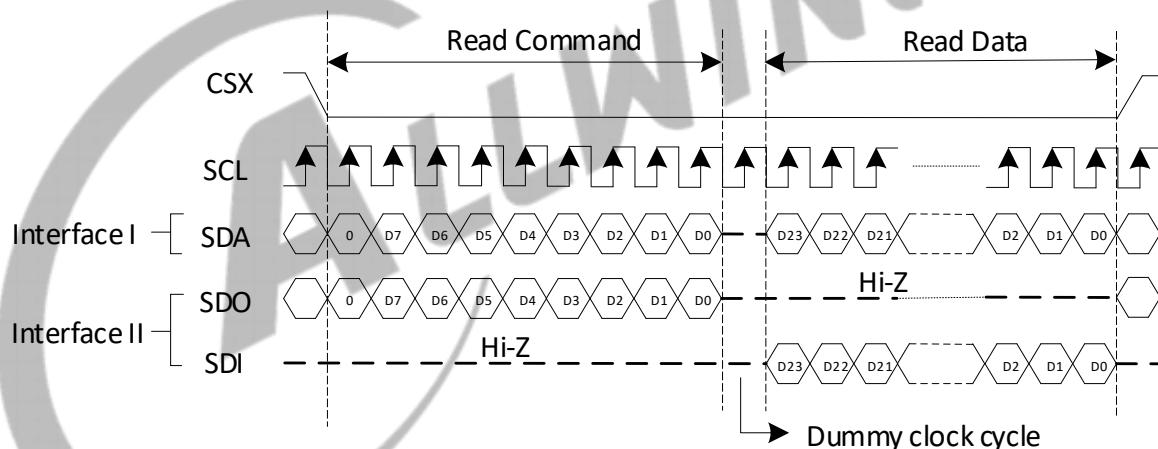

The 3-line DBI Interface I uses the SDA port as bidirectional data input and output port. There are only three cases of data reading volume, 8bits/24bits/32bits, and the first data sampled is high.

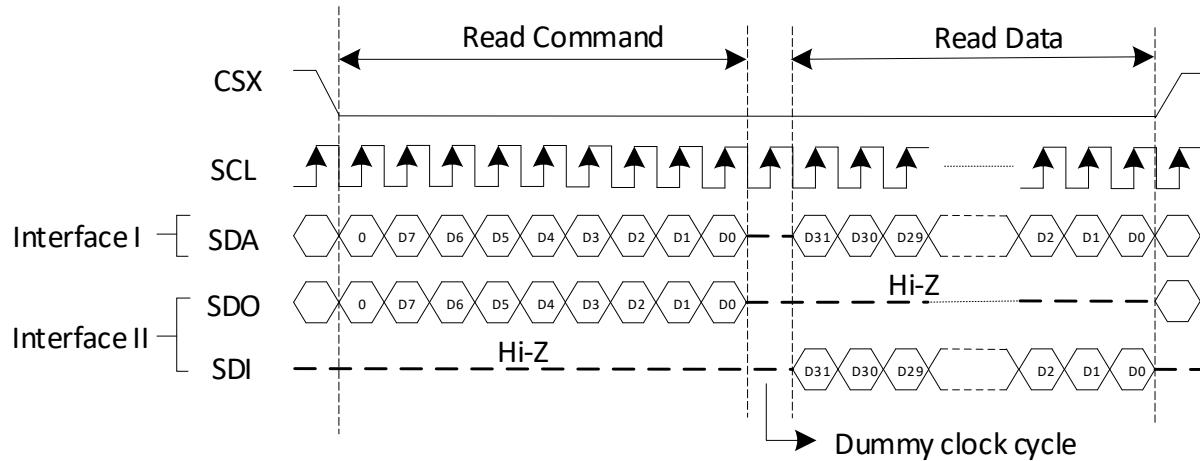

The following figure shows the 8 bits reading operation format of 3-line DBI Interface I and Interface II. After the read command is transmitted, the data is read immediately with on dummy period.

Figure 9-40 DBI 3-Line Display Bus Serial Interface 8-bit Reading Operation Format

The following figure shows the 24 bits reading operation format of 3-line DBI Interface I and Interface II. After the read command is transmitted, the data is read after waiting for the dummy clock cycle.

Figure 9-41 DBI 3-Line Display Bus Serial Interface 24-bit Reading Operation Format

The following figure shows the 32 bits reading operation format of 3-line DBI Interface I and Interface II. After the read command is transmitted, the data is read after waiting for the dummy clock cycle.

Figure 9-42 DBI 3-Line Display Bus Serial Interface 32-bit Reading Operation Format

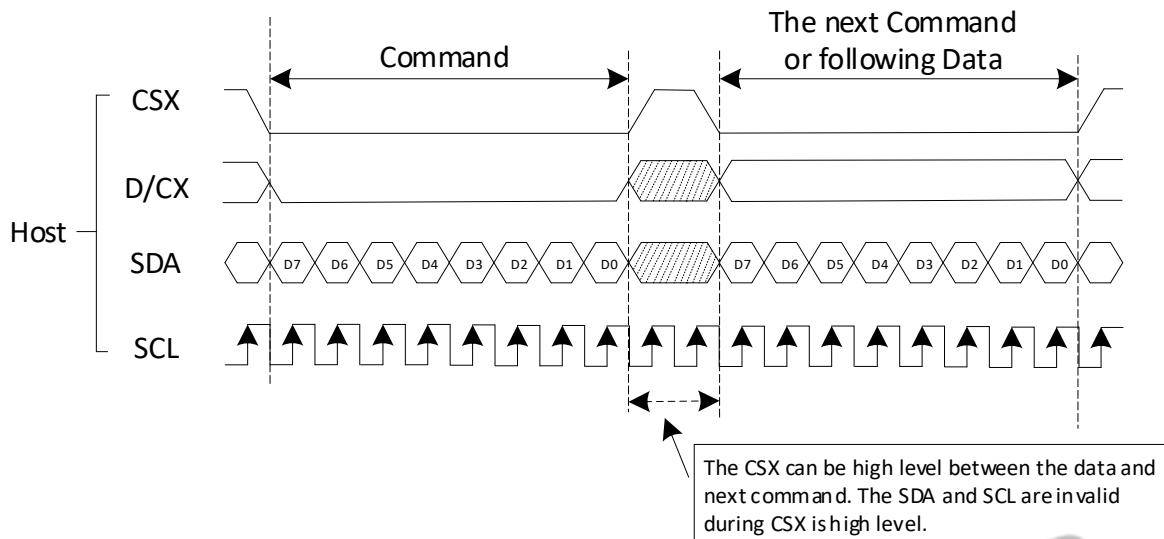

9.4.3.12 DBI 4-Line Interface Writing and Reading Timing

The 4-line DBI Interface I contains CSX, D/CX, SDA, and SCL, where SDA shares this port for bidirectional port data input and output.

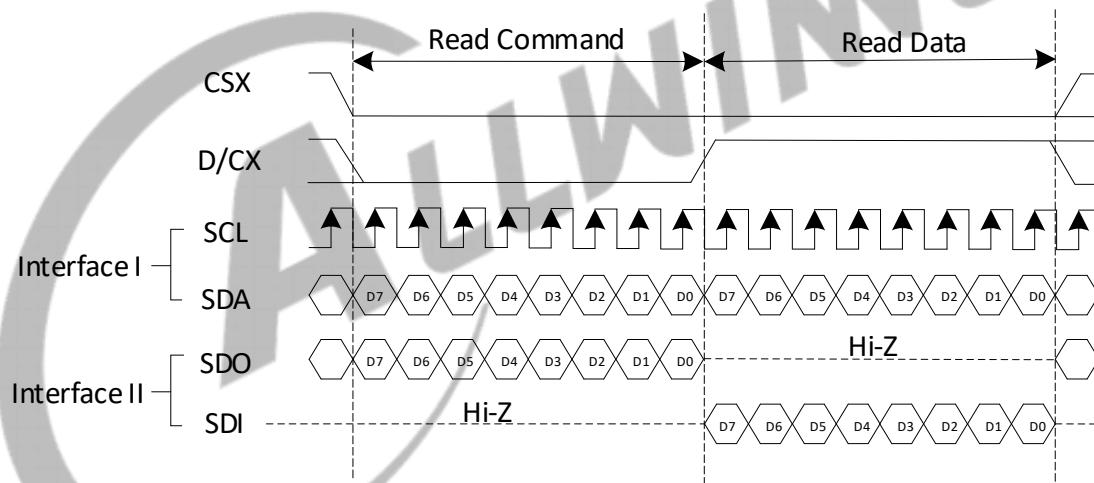

The 4-line DBI Interface II contains CSX, D/CX, SDA, SCL, and SDI; Data input and output ports are independent of each other.

Since the 4-line display bus mode has a Data/Command data line indicating whether Data or Command is currently being transmitted (0: Command, 1: Data). So there is no need to add an extra bit to data-stream before MSB like the 3-line DBI.

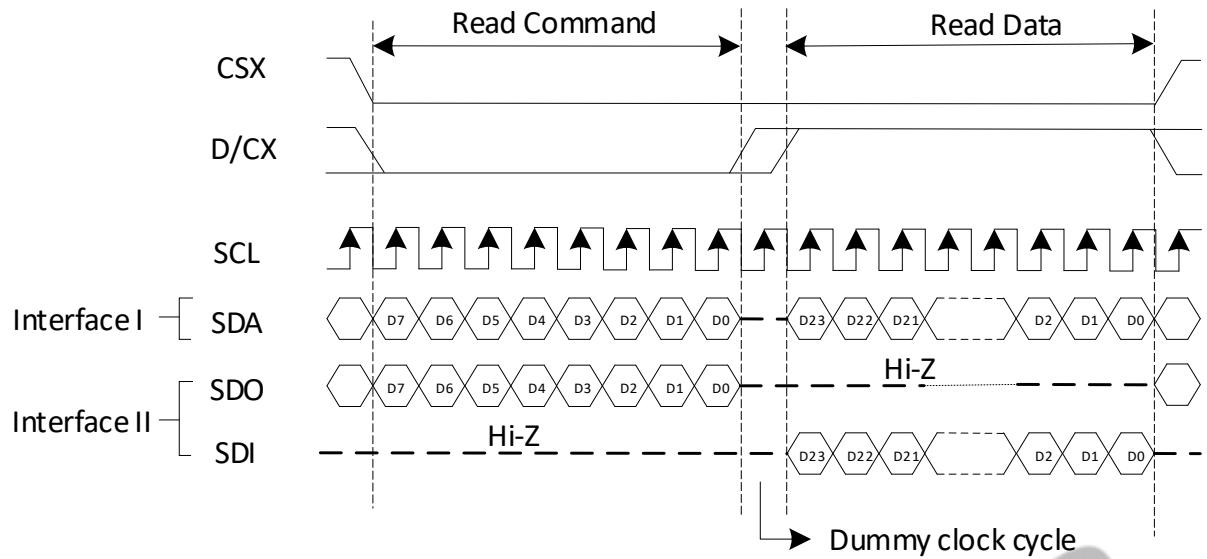

The following figure shows the writing operation format of 4-line DBI Interface I and Interface II.

9.4.4 Programming Guidelines

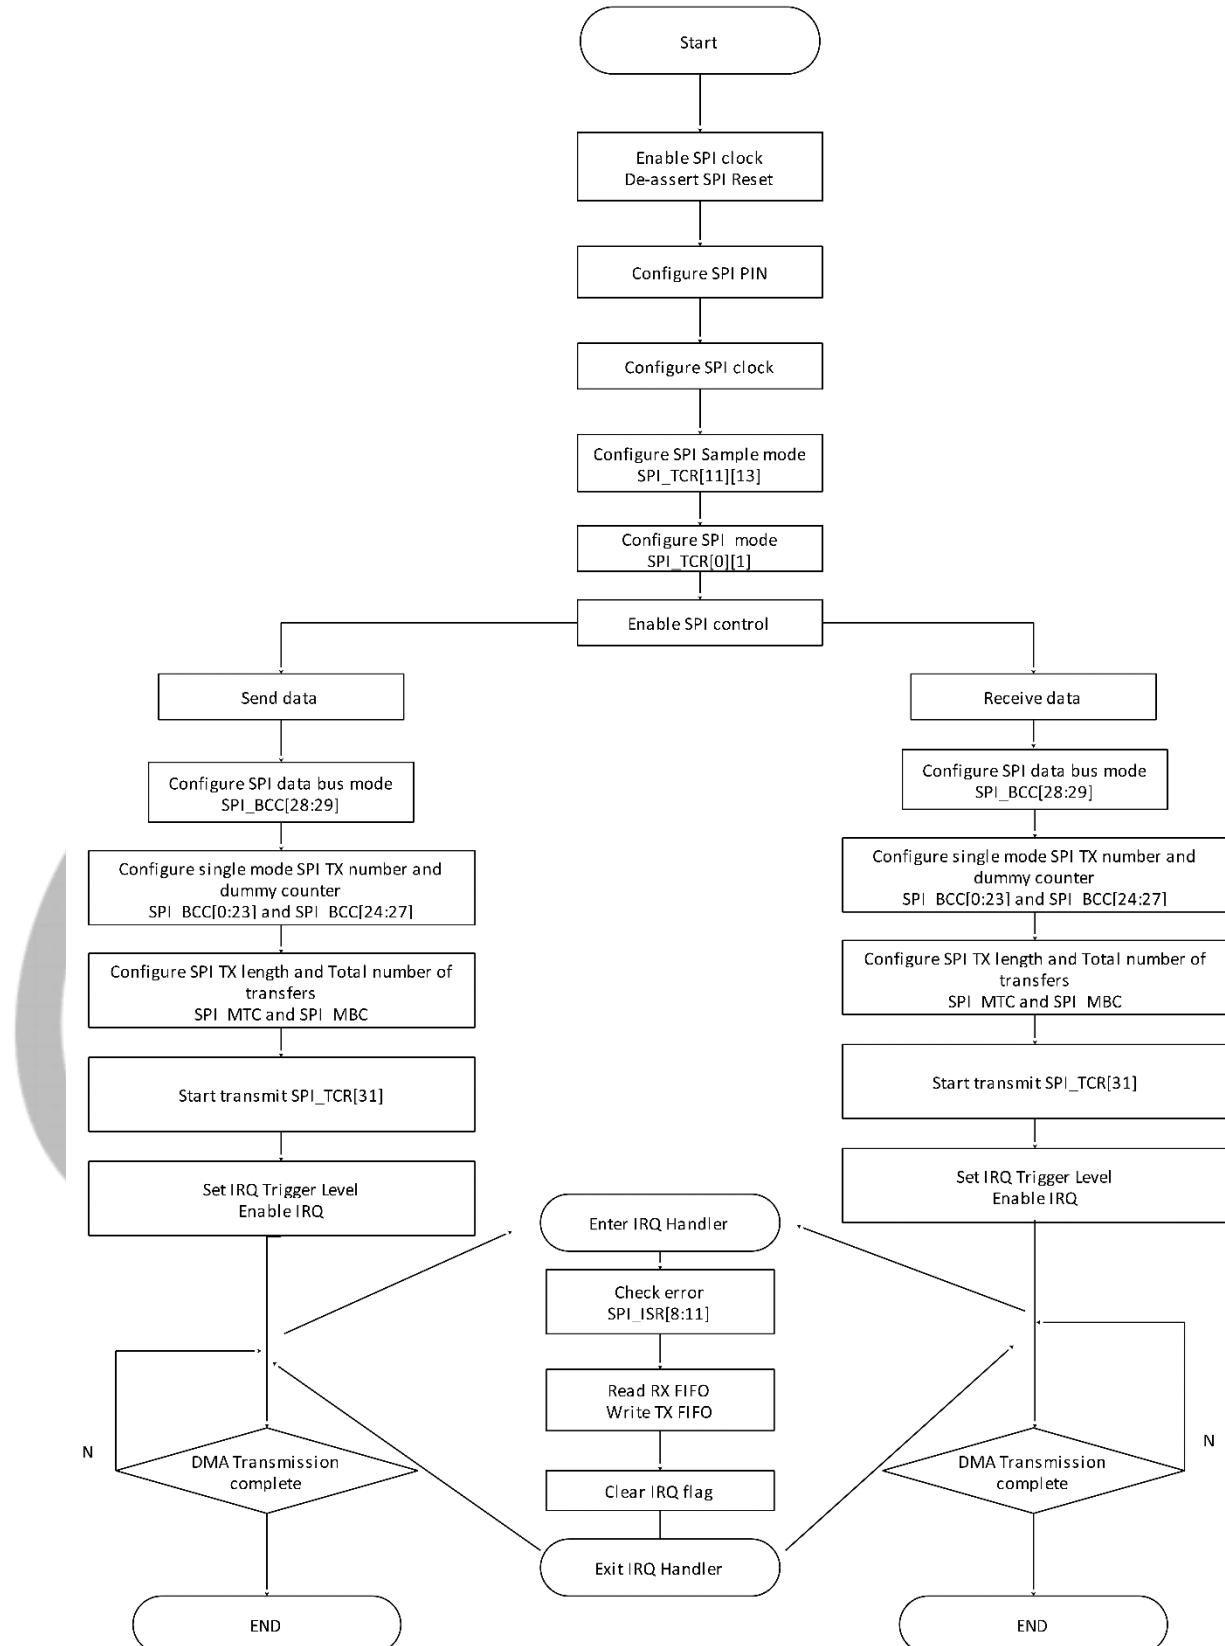

9.4.4.1 Writing/Reading Data Process Using SPI Mode

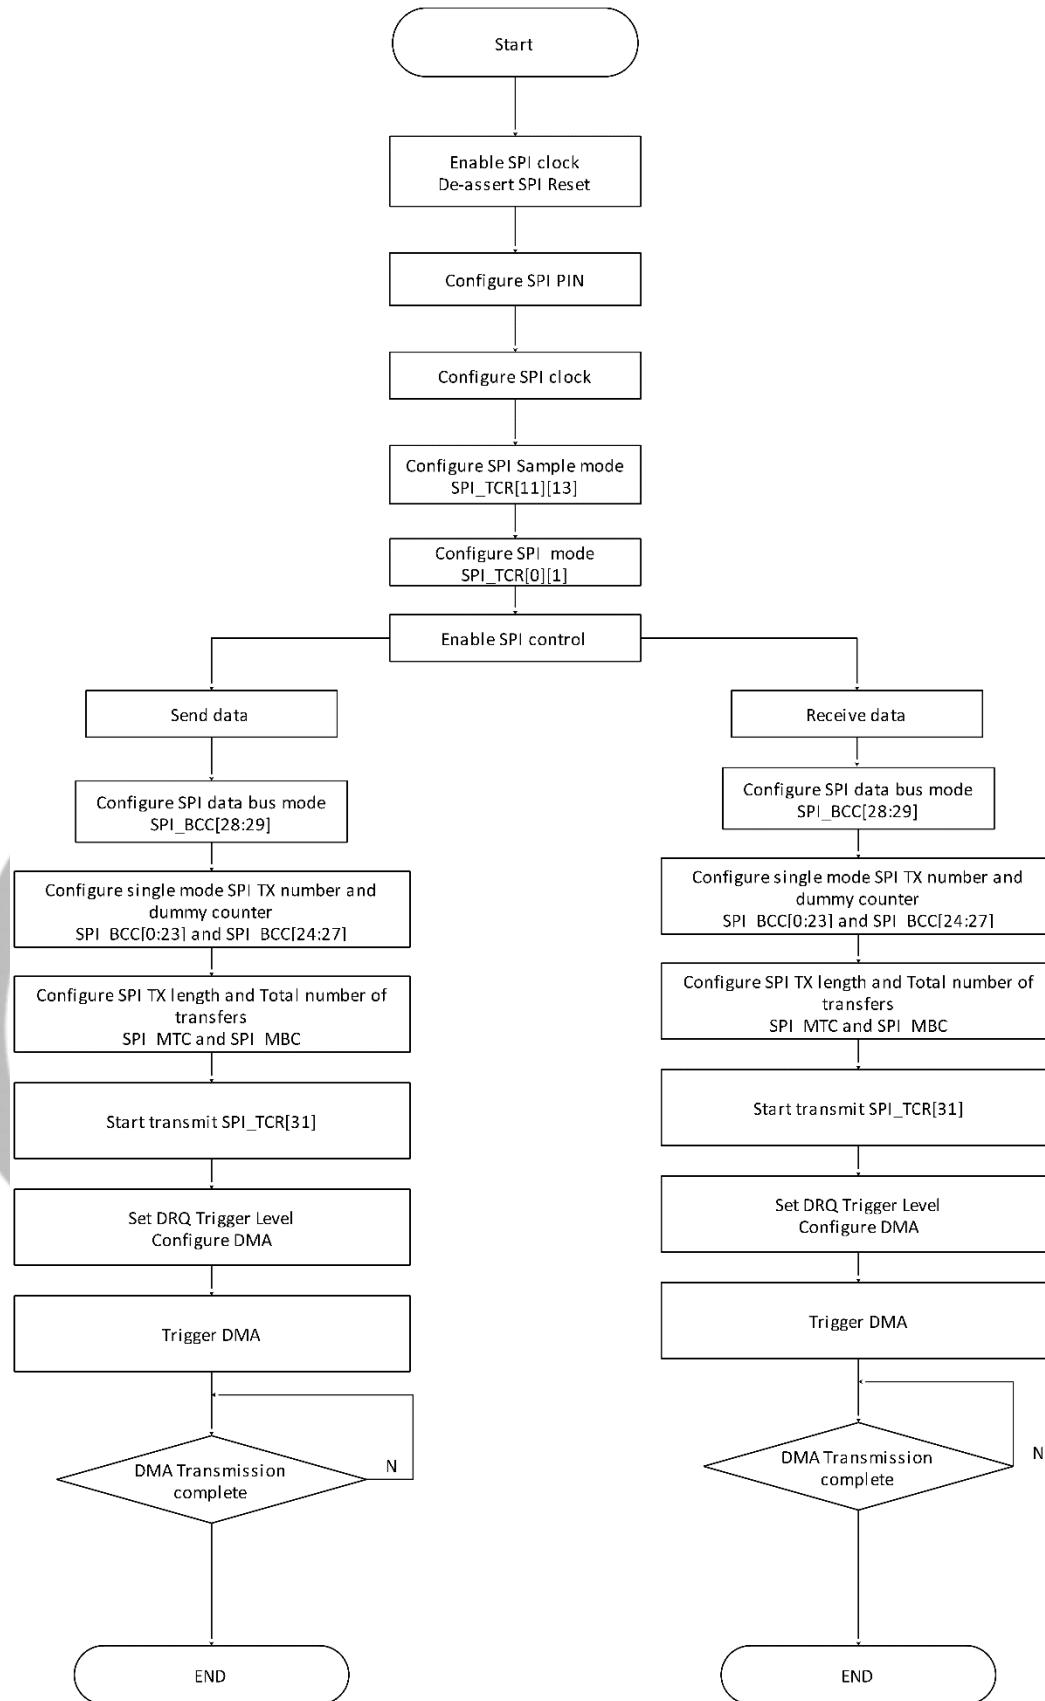

The SPI transfers serial data between the processor and the external device. CPU and DMA are the two main operational modes for SPI. For each SPI, the data is simultaneously transmitted (shifted out serially) and received (shifted in serially). The SPI has 2 channels, including the TX channel and RX channel. The TX channel has the path from TX FIFO to the external device. The RX channel has the path from the external device to RX FIFO.

Write Data: CPU or DMA must write data on the [SPI_TXD](#) register, the data on the register are automatically moved to TX FIFO.

Read Data: To read data from RX FIFO, CPU or DMA must access the register [SPI_RXD](#) and data are automatically sent to the register [SPI_RXD](#).

In CPU or DMA mode, the SPI sends a completed interrupt ([SPI_ISR\[TC\]](#)) to the processor at the end of each transfer.

DMA Mode**Figure 9-62 SPI Write/Read Data in DMA Mode**

9.4.4.2 Calibrate Delay Chain Using SPI Mode

The SPI has one delay chain which is used to generate delay to make proper timing between the internal SPI clock signal and data signals. Delay chain is made up of 64 delay cells. The delay time of one delay cell can be estimated through delay chain calibration.

The steps to calibrate delay chain are as follows:

- Step 1** Enable SPI. To calibrate the delay chain by operation registers in SPI, the SPI must be enabled through AHB reset and AHB clock gating control registers.
- Step 2** Configure a proper clock for SPI. The calibration delay chain is based on the clock for SPI from CCU.
- Step 3** Set proper initial delay value. Write 0xA0 to the [SPI Sample Delay Control Register](#) to set initial delay value 0x20 to delay chain. Then write 0x0 to the [SPI Sample Delay Control Register](#) to clear this value.
- Step 4** Write 0x8000 to the [SPI Sample Delay Control Register](#) to start to calibrate the delay chain.
- Step 5** Wait until the flag (Bit14 in the [SPI Sample Delay Control Register](#)) of calibration done is set. The number of delay cells is shown at Bit[13:8] in [SPI Sample Delay Control Register](#). The delay time generated by these delay cells is equal to the cycle of SPI's clock nearly. This value is the result of calibration.
- Step 6** Calculate the delay time of one delay cell according to the cycle of the SPI clock and the result of calibration.

9.4.4.3 Transmitting Write Command Using DBI Mode

- Step 1** Set the [SPI_DBI_MODE_SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.
- Step 2** Set the [DBI EN MODE SEL](#) (bit[30:29]) of [DBI_CTL_1](#) (0x0104) to 0 to select the trigger mode of DBI.
- Step 3** Configure the [DBI_CTL_0](#) (0x0100).
 - Set [DBI_CTL_0\[Command Type\]](#) (bit31) to 0 to configure the writing command.
 - Set [DBI_CTL_0\[Write Command Dummy Cycles\]](#) (bit[30:20]) to configure the number of dummy cycles between commands.
 - Set [DBI_CTL_0\[Output Data Sequence\]](#) (bit19) to select the MSB or LSB.
 - Set [DBI_CTL_0\[Transmit Mode\]](#) (bit15) to 0 to select the command path.
 - Set [DBI_CTL_0\[Output Data Format\]](#) (bit[14:12]) to 0 to transmit the command.
 - Set [DBI_CTL_0\[DBI interface Select\]](#) (bit[10:8]) to select the DBI interface type.
 - The remaining values of the [DBI_CTL_0](#) register remain the default value.

Step 4 Set [DBI_CTL_1\[DCX_DATA\]](#) (bit22) to 0 to send the command.

Step 5 DMA Path: Configure the [SPI_FCR](#) register (0x0018).

- Set [SPI_FCR\[TF_DRQ_EN\]](#) (bit24) to 1 to enable TXFIFO DMA.
- Set [SPI_FCR\[TX_TRIG_LEVEL\]](#) (bit[23:16]) to 255. It indicates the controller requests data from DMA if the remaining space of TX FIFO is greater than 255.

CPU Path: Write the command to be sent to the 0x200 address.

Step 6 Set [SPI_GCR\[DBI_EN\]](#) (bit4) to 1 to start transmitting the command.

Step 7 Wait until the TX FIFO underrun interrupt ([SPI_ISR\[TF_UDF\]](#)) is 1. It indicates that the command written to the TX FIFO is transmitted completely.

9.4.4.4 Transmitting Parameter Using DBI Mode

Step 1 Set the [SPI_DBI_MODE_SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.

Step 2 Set the [DBI_EN_MODE_SEL](#) (bit[30:29]) of [DBI_CTL_1](#) (0x0104) to 0 to select the trigger mode of DBI.

Step 3 Configure the [DBI_CTL_0](#) register (0x0100).

- Set [DBI_CTL_0\[Command Type\]](#) (bit31) to 0 to configure the writing command.
- Set [DBI_CTL_0\[Write Command Dummy Cycles\]](#) (bit[30:20]) to configure the number of dummy cycles between commands.
- Set [DBI_CTL_0\[Output Data Sequence\]](#) (bit19) to select the MSB or LSB.
- Set [DBI_CTL_0\[Transmit Mode\]](#) (bit15) to 0 to select the command path.
- Set [DBI_CTL_0\[Output Data Format\]](#) (bit[14:12]) to 0 to transmit the command.
- Set [DBI_CTL_0\[DBI interface Select\]](#) (bit[10:8]) to select the DBI interface type.
- The remaining values of the [DBI_CTL_0](#) register remain the default value.

Step 4 Set [DBI_CTL_1\[DCX_DATA\]](#) (bit22) to 1 to send the parameter.

Step 5 DMA Path: Configure the [C:\Users\zengjing\Downloads\ Hlk49435465 - Hlk49435792](#) register (0x0018).

- Set [SPI_FCR\[TF_DRQ_EN\]](#) (bit24) to 1 to enable TXFIFO DMA.
- Set [SPI_FCR\[TX_TRIG_LEVEL\]](#) (bit[23:16]) to 255. It indicates the controller requests data from DMA if the remaining space of TX FIFO is greater than 255.

CPU Path: Write the command to be sent to the 0x0200 address.

Step 6 Set [SPI_GCR\[DBI_EN\]](#) (bit4) to 1 to start transmitting the command.

Step 7 Wait until the TX FIFO underrun interrupt ([SPI ISR](#)[TF_UDF]) is 1. It indicates that the command written to the TX FIFO is transmitted completely.

9.4.4.5 Transmitting Video Using DBI Mode

Set the [SPI DBI MODE SEL](#) (bit3) of [SPI GCR](#) (0x0004) to 1 to select DBI mode.

If the data is from the CPU path, the controller writes the command to be sent to the 0x0200 address by the AHB bus.

If the data is from the DMA path, configure [DBI CTL 1](#)[DBI_FIFO_DRQ_EN] (bit15) to 1 and [DBI CTL 1](#)[TX_TRIG_LEVEL] (bit[14:8]) to 64, which indicates the controller requests data from DMA if the remaining space of TX FIFO is greater than 64.

Software Trigger Mode

The software enables DBI_en_trigger when the edge interrupt of TE is detected.

After transmitting each frame image, the controller clears automatically the line_cnt, pixel_cnt and stops transmitting data.

Wait for the edge interrupt of TE, the software needs to enable DBI_en_trigger, in circulation.

The operation process is as follows.

Step 1 Set the [SPI DBI MODE SEL](#) (bit3) of [SPI GCR](#) (0x0004) to 1 to select DBI mode.

Step 2 Set the [DBI EN MODE SEL](#) (bit[30:29]) of [DBI CTL 1](#) (0x0104) to 1 to select the software trigger mode.

Step 3 Configure the [DBI CTL 0](#) register (0x0100).

- Set [DBI CTL 0](#)[Command Type] (bit31) to 0 to set the writing command.
- Set [DBI CTL 0](#)[Write Command Dummy Cycles] (bit[30:20]) to configure the number of dummy cycles between commands.
- Set [DBI CTL 0](#)[Output Data Sequence] (bit19) to select the MSB or LSB.
- Set [DBI CTL 0](#)[Transmit Mode] (bit15) to 1 to select the image path.
- Set [DBI CTL 0](#)[Output Data Format] (bit[14:12]) to select RGB111//444/565/666/888.
- Set [DBI CTL 0](#)[DBI interface Select] (bit[10:8]) to select the DBI interface type.
- The remaining values of the [DBI CTL 0](#) register remain the default value.

Step 4 Set [DBI CTL 1](#)[DCX_DATA] (bit22) to 0 to send the image data.

Step 5 Configure [DBI Video Size](#) (0x110) according to the sent image size.

Step 6 Configure [DBI_CTL_2](#) (0x0108) to set the TE-related parameter.

Step 7 Detect the TE interrupt of the [DBI_INT](#) (0x0120) register.

Step 8 Configure [DBI_CTL_1](#)[DBI_soft_trigger] to 1.

Timer Trigger Mode

The software configures timer_en to enable timer counting, and when the counter reaches the specified value, the DBI_EN automatically can be enabled to start transmitting data.

After transmitting each frame image, the controller clears automatically the line_cnt, pixel_cnt, and stops transmitting data.

The timer starts counting again. When the counter reaches the specified value, the controller automatically enables DBI_EN, and in circulation until the software turns off the timer_en.

The operation process is as follows.

Step 1 Set the [SPI_DBI_MODE_SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.

Step 2 Set the [DBI_EN_MODE_SEL](#) (bit30:29) of [DBI_CTL_1](#) (0x0104) to 2 to select the timer trigger mode.

Step 3 Configure the [DBI_CTL_0](#) register (0x0100).

- Set [DBI_CTL_0](#)[Command Type] (bit31) to 0 to set the writing command.
- Set [DBI_CTL_0](#)[Write Command Dummy Cycles] (bit[30:20]) to configure the number of dummy cycles between commands.
- Set [DBI_CTL_0](#)[Output Data Sequence] (bit19) to select the MSB or LSB.
- Set [DBI_CTL_0](#)[Transmit Mode] (bit15) to 1 to select the image path.
- Set [DBI_CTL_0](#)[Output Data Format] (bit[14:12]) to select RGB111/444/565/666/888.
- Set [DBI_CTL_0](#)[DBI interface Select] (bit[10:8]) to select the DBI interface type.
- The remaining values of the [DBI_CTL_0](#) register remain the default value.

Step 4 Set [DBI_CTL_1](#)[DCX_DATA] (bit22) to 0 to send the image data.

Step 5 Configure [DBI_Video_Size](#) (0x110) to transmit the image size.

Step 6 Configure the related parameter of [DBI_Timer](#) (0x10C).

TE Trigger Mode

When the edge changes of the TE are detected (The rising and falling edges are optional), the DBI_EN automatically can be enabled to start transmitting data.

After transmitting each frame image, the controller clears automatically the line_cnt, pixel_cnt, and stops transmitting data.

When the edge changes of the TE are detected (The rising and falling edges are optional), the DBI_EN automatically can be enabled to start transmitting data until the software shuts down TE_EN or the screen no longer sends TE signals.

The operation process is as follows.

Step 1 Set the [SPI_DBI_MODE_SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.

Step 2 Set the [DBI_EN_MODE_SEL](#) (bit30:29) of [DBI_CTL_1](#) (0x0104) to 3 to select the TE trigger mode.

Step 3 Configure the [DBI_CTL_0](#) register (0x0100).

- Set [DBI_CTL_0\[Command Type\]](#) (bit31) to 0 to set the writing command.
- Set [DBI_CTL_0\[Write Command Dummy Cycles\]](#) (bit[30:20]) to configure the number of dummy cycles between commands.
- Set [DBI_CTL_0\[Output Data Sequence\]](#) (bit19) to select the MSB or LSB.
- Set [DBI_CTL_0\[Transmit Mode\]](#) (bit15) to 1 to select the image path.
- Set [DBI_CTL_0\[Output Data Format\]](#) (bit[14:12]) to select RGB111/444/565/666/888.
- Set [DBI_CTL_0\[DBI interface Select\]](#) (bit[10:8]) to select the DBI interface type.
- The remaining values of the [DBI_CTL_0](#) register remain the default value.

Step 4 Configure [DBI_CTL_1\[DCX_DATA\]](#) (bit22) to 0 to send the image data.

Step 5 Configure [DBI_Video_Size](#) (0x0110) to transmit the image size.

Step 6 Configure [DBI_CTL_2](#) (0x0108) to set the TE-related parameter.

9.4.4.6 Transmitting Read Command and Read Data Using DBI Mode

Step 1 Set the [SPI_DBI_MODE_SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.

Step 2 Set the [DBI_EN_MODE_SEL](#) (bit[30:29]) of [DBI_CTL_1](#) (0x0104) to 0.

Step 3 Configure the [DBI_CTL_0](#) register (0x0100).

- Set [DBI_CTL_0\[Command Type\]](#) (bit31) to 0 to set the reading command.
- Set [DBI_CTL_0\[Output Data Sequence\]](#) (bit19) to select the MSB or LSB.
- Set [DBI_CTL_0\[Transmit Mode\]](#) (bit15) to 0 to select the command path.
- Set [DBI_CTL_0\[Output Data Format\]](#) (bit[14:12]) to 0.
- Set [DBI_CTL_0\[DBI interface Select\]](#) (bit[10:8]) to select the DBI interface type.

- The remaining values of the [DBI_CTL_0](#) register remain the default value.

Step 4 Configure the [DBI_CTL_1](#) register (0x0104).

- Configure [DBI_CTL_1](#)[DCX_DATA] (bit22) to 0 to send the command.
- Configure [DBI_CTL_1](#)[Read_MSB_First] (bit20) to select whether the first bit of the read data is the highest or lowest bit of data.
- Configure [DBI_CTL_1](#)[Read Data Number of Bytes] to set the byte number to be read.
- Configure [DBI_CTL_1](#)[Read Command Dummy Cycles] to set the dummy cycle between the read command and the read data, when the dummy cycle is complete, the data starts to be sampled.

Step 5 DMA Path: Configure the [SPI_FCR](#) register (0x0018).

- Set [SPI_FCR](#)[RF_DRQ_EN] (bit8) to 1 to enable RXFIFO DMA.
- Set [SPI_FCR](#)[RX_TRIG_LEVEL] (bit[7:0]) to 32, which indicates the controller requests receiving data from DMA if the data of the RX FIFO is greater than 64.

CPU Path: Read data in RX FIFO from the 0x0300 address.

Step 6 Set [SPI_GCR](#)[DBI_EN] (bit4) to 1 to start transmitting command.

Step 7 Wait until [DBI_INT](#)[RD_DONE_INT] is 1. It indicates that the data is read completely.

In the word accessing method, the four SPI bursts are returned and the RXFIFO depth is decreased by 4.</p> <p>Note: This address is readable-only if RF_TEST is '0', and if RF_TEST is set to '1', this address is readable and writable to test the RX FIFO through the AHB bus.</p>

9.5 USB2.0 DRD

9.5.1 Overview

The USB2.0 dual-role device (USB2.0 DRD) supports both device and host functions which can also be configured as a Host-only or Device-only controller. It complies with the USB2.0 Specification.

For saving CPU bandwidth, the DMA interface of the DRD module can also support the external DMA controller to do the data transfer between the memory and the DRD FIFO. The DRD core also supports USB power saving functions.

The USB2.0 DRD has the following features:

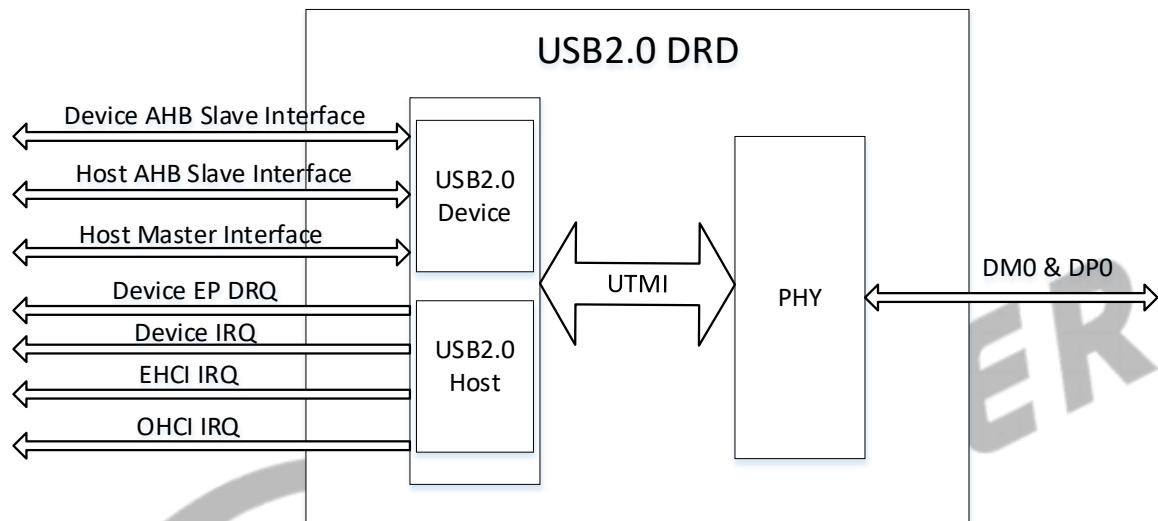

- Complies with USB2.0 Specification
 - Compatible with Enhanced Host Controller Interface (EHCI) Specification, Version 1.0
 - Compatible with Open Host Controller Interface (OHCI) Specification, Version 1.0a
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s), and Low-Speed (LS, 1.5 Mbit/s)
 - Supports only 1 USB Root port shared between EHCI and OHCI
- Supports USB Device function
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s)
 - Supports bi-directional endpoint0 (EP0) for Control transfer
 - Up to 10 user-configurable endpoints (EP1+, EP1-, EP2+, EP2-, EP3+, EP3-, EP4+, EP4-, EP5+, EP5-) for Bulk transfer, Isochronous transfer and Interrupt transfer
 - Up to (8 KB + 64 Bytes) FIFO for all EPs (including EP0)
 - Supports interface to an external Normal DMA controller for every EP
- Supports an internal DMA controller for data transfer with memory
- Supports High-Bandwidth Isochronous & Interrupt transfers
- Automated splitting/combining of packets for Bulk transfers
- Supports point-to-point and point-to-multipoint transfer in both Host and Peripheral modes
- Includes automatic ping capabilities
- Soft connect/disconnect function
- Performs all transaction scheduling in hardware
- Power optimization and power management capabilities

- Device and host controller share a 8K SRAM and a physical PHY

9.6 USB2.0 HOST

9.6.1 Overview

The USB Host Controller is fully compliant with USB 2.0 Specification, Enhanced Host Controller Interface (EHCI) Specification Revision 1.0 and Open Host Controller Interface (OHCI) Specification Release 1.0a.

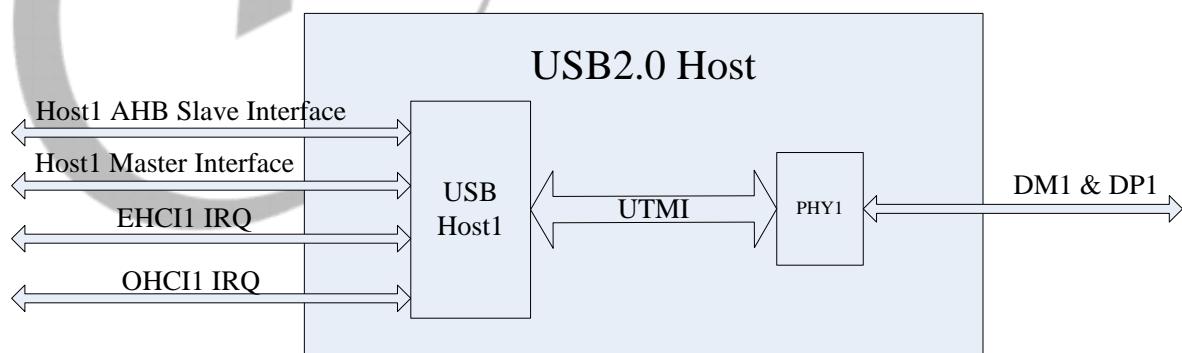

The USB2.0 host controller includes the following features:

- Complies with USB2.0 Specification
- Supports USB2.0 Host function
 - Compatible with Enhanced Host Controller Interface (EHCI) Specification, Version 1.0
 - Compatible with Open Host Controller Interface (OHCI) Specification, Version 1.0a
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s) and Low-Speed (LS, 1.5 Mbit/s) Device
 - Supports only 1 USB Root port shared between EHCI and OHCI
- An internal DMA Controller for data transfer with memory

9.6.5 EHCI Register Description

9.6.5.1 0x0000 EHCI Identification Register (Default Value:0x10)

Offset:0x0000			Register Name: CAPLENGTH
Bit	Read/Write	Default/Hex	Description
7:0	R	0x10	CAPLENGTH The value in these bits indicates an offset to add to register base to find the beginning of the Operational Register Space.

9.6.5.2 0x0002 EHCI Host Interface Version Number Register (Default Value:0x0100)

Offset: 0x0002			Register Name: HCIVERSION
Bit	Read/Write	Default/Hex	Description
15:0	R	0x0100	HCIVERSION This is a 16-bit register containing a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision.

9.6.5.3 0x0004 EHCI Host Control Structural Parameter Register (Default Value:0x0000_1101)

Offset: 0x0004			Register Name: HCSPARAMS
Bit	Read/Write	Default/Hex	Description
31:24	/	/	/
23:20	R	0x0	Debug Port Number

Offset: 0x0004			Register Name: HCSPARAMS						
Bit	Read/Write	Default/Hex	Description						
			<p>This register identifies which of the host controller ports is the debug port. The value is the port number (one based) of the debug port.</p> <p>This field will always be '0'.</p>						
19:16	/	/	/						
15:12	R	0x1	<p>Number of Companion Controller (N_CC)</p> <p>This field indicates the number of companion controllers associated with this USB2.0 host controller. A zero in this field indicates there are no companion host controllers. And a value larger than zero in this field indicates there are companion USB1.1 host controller(s).</p> <p>This field will always be '0'.</p>						
11:8	R	0x1	<p>Number of Port per Companion Controller (N_PCC)</p> <p>This field indicates the number of ports supported per companion host controller host controller. It is used to indicate the port routing configuration to system software.</p> <p>This field will always fix with '0'.</p>						
7	R	0x0	<p>Port Routing Rules</p> <p>This field indicates the method used by this implementation for how all ports are mapped to companion controllers. The value of this field has the following interpretation:</p> <table border="1"> <thead> <tr> <th>Value</th><th>Meaning</th></tr> </thead> <tbody> <tr> <td>0</td><td>The first N_PCC ports are routed to the lowest numbered function companion host controller, the next N_PCC port are routed to the next lowest function companion controller, and so on.</td></tr> <tr> <td>1</td><td>The port routing is explicitly enumerated by the first N_PORTS elements of the HCSP-PORTTOUTE array.</td></tr> </tbody> </table> <p>This field will always be '0'.</p>	Value	Meaning	0	The first N_PCC ports are routed to the lowest numbered function companion host controller, the next N_PCC port are routed to the next lowest function companion controller, and so on.	1	The port routing is explicitly enumerated by the first N_PORTS elements of the HCSP-PORTTOUTE array.
Value	Meaning								
0	The first N_PCC ports are routed to the lowest numbered function companion host controller, the next N_PCC port are routed to the next lowest function companion controller, and so on.								
1	The port routing is explicitly enumerated by the first N_PORTS elements of the HCSP-PORTTOUTE array.								
6:4	/	/	/						
3:0	R	0x1	<p>N_PORTS</p> <p>This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 0x1 to 0x0f.</p> <p>This field is always 1.</p>						

9.6.5.4 0x0008 EHCI Host Control Capability Parameter Register (Default Value:0x0000_A026)

Offset: 0x0008			Register Name: HCCPARAMS
Bit	Read/Write	Default/Hex	Description
31:16	/	/	/
15:8	R	0xA0	<p>EHCI Extended Capabilities Pointer (EECP)</p> <p>This optional field indicates the existence of a capabilities list. A value of 00b indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in PCI configuration space of the first EHCI extended capability. The pointer value must be 40h or greater if implemented to maintain consistency of the PCI header defined for this class of device.</p> <p>The value of this field is always '00b'.</p>
7:4	R	0x2	<p>Isochronous Scheduling Threshold</p> <p>This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule.</p> <p>When bit[7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller can hold a set of isochronous data structures(one or more) before flushing the state. When bit[7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame.</p>
3	/	/	/
2	R	0x1	<p>Asynchronous Schedule Park Capability</p> <p>If this bit is set to a one, then the host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule. The feature can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the USBCMD register.</p>
1	R	0x1	<p>Programmable Frame List Flag</p> <p>If this bit is set to a zero, then system software must use a frame list length of 1024 elements with this host controller. The USBCMD register Frame List Size field is a read-only register and should be set to zero.</p> <p>If set to 1, then system software can specify and use the frame list in the USBCMD register Frame List Size field to configure the host controller.</p> <p>The frame list must always aligned on a 4K page boundary. This requirement ensures that the frame list is always physically contiguous.</p>

9.6.5.5 0x000C EHCI Companion Port Route Description (Default Value:0x0000_0000)

Offset: 0x000C			Register Name: HCSP-PORTROUTE
Bit	Read/Write	Default/Hex	Description
31:0	R	0x0	<p>HCSP-PORTROUTE</p> <p>This optional field is valid only if Port Routing Rules field in HCSPARAMS register is set to a one.</p> <p>This field is used to allow a host controller implementation to explicitly describe to which companion host controller each implemented port is mapped. This field is a 15-element nibble array (each 4 bit is one array element). Each array location corresponds one-to-one with a physical port provided by the host controller (e.g. PORTROUTE [0] corresponds to the first PORTSC port, PORTROUTE [1] to the second PORTSC port, etc.). The value of each element indicates to which the companion host controllers this port is routed. Only the first N_PORTS elements have valid information. A value of zero indicates that the port is routed to the lowest numbered function companion host controller. A value of one indicates that the port is routed to the next lowest numbered function companion host controller, and so on.</p>

Bit	Read/Write	Default/Hex	Description
1	R/W	0x0	<p>Host Controller Reset This control bit is used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset.</p> <p>When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports.</p> <p>All operational registers, including port registers and port state machines are set to their initial values. Port ownership reverts to the companion host controller(s). Software must reinitialize the host controller as described in Section 4.1 of the CHEI Specification in order to return the host controller to an operational state.</p> <p>This bit is set to zero by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register.</p> <p>Software should not set this bit to a one when the HC Halted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller will result in undefined behavior.</p>
0	R/W	0x0	<p>Run/Stop When set to a 1, the Host Controller proceeds with execution of the schedule. When set to 0, the Host Controller completes the current and any actively pipelined transactions on the USB and then halts. The Host Controller must halt within 16 micro-frames after software clears this bit.</p> <p>The HC Halted bit indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state.</p> <p>Software must not write a one to this field unless the Host Controller is in the Halt State.</p> <p>The default value is 0x0.</p>

9.6.5.7 0x0014 EHCI USB Status Register (Default Value:0x0000_1000)

Offset: 0x0014			Register Name: USBSTS
Bit	Read/Write	Default/Hex	Description
31:16	/	/	/
15	R	0x0	Asynchronous Schedule Status

Offset: 0x0014			Register Name: USBSTS
Bit	Read/Write	Default/Hex	Description
			The bit reports the current real status of Asynchronous Schedule. If this bit is a zero then the status of the Asynchronous Schedule is disabled. If this bit is a one then the status of the Asynchronous Schedule is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled (1) or disabled (0).
14	R	0x0	Periodic Schedule Status The bit reports the current real status of the Periodic Schedule. If this bit is a zero then the status of the Periodic Schedule is disabled. If this bit is a one then the status of the Periodic Schedule is enabled. The Host Controller is not required to <i>immediately</i> disable or enable the Periodic Schedule when software transitions the <i>Periodic Schedule Enable</i> bit in the USBCMD register. When this bit and the <i>Periodic Schedule Enable</i> bit are the same value, the Periodic Schedule is either enabled (1) or disabled (0).
13	R	0x0	Reclamation This is a read-only status bit, which is used to detect an empty asynchronous schedule.
12	R	0x1	HC Halted This bit is a zero whenever the Run/Stop bit is a one. The Host Controller Sets this bit to one after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller Hardware (e.g. internal error). The default value is '1'.
11:6	/	/	/
5	R/WC	0x0	Interrupt on Async Advance System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source.
4	R/WC	0x0	Host System Error The Host Controller set this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs.
3	R/WC	0x0	Frame List Rollover

Offset: 0x0014			Register Name: USBSTS
Bit	Read/Write	Default/Hex	Description
			The Host Controller sets this bit to a one when the Frame List Index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size is 1024, the Frame Index Register rolls over every time FRINDEX [13] toggles. Similarly, if the size is 512, the Host Controller sets this bit to a one every time FRINDEX [12] toggles.
2	R/WC	0x0	Port Change Detect The Host Controller sets this bit to a one when any port for which the Port Owner bit is set to zero has a change bit transition from a zero to a one or a Force Port Resume bit transition from a zero to a one as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Chang being set to a one after system software has relinquished ownership of a connected port by writing a one to a port's Port Owner bit.
1	R/WC	0x0	USB Error Interrupt(USBERRINT) The Host Controller sets this bit to 1 when completion of USB transaction results in an error condition(e.g. error counter underflow).If the TD on which the error interrupt occurred also had its IOC bit set, both. This bit and USBINT bit are set.
0	R/WC	0x0	USB Interrupt(USBINT) The Host Controller sets this bit to a one on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set. The Host Controller also sets this bit to 1 when a short packet is detected (actual number of bytes received was less than the expected number of bytes)

9.6.5.10 0x0024 EHCI Periodic Frame List Base Address Register (Default Value:0x0000_0000)

Offset: 0x0024			Register Name: PERIODICLISTBASE		
Bit	Read/Write	Default/Hex	Description		
31:12	R/W	0x0	Base Address These bits correspond to memory address signals [31:12], respectively. This register contains the beginning address of the Periodic Frame List in the system memory. System software loads this register prior to starting the schedule execution by the Host Controller. The memory structure referenced by this physical memory pointer is assumed to be 4 Kbyte aligned. The contents of this register are combined with the Frame Index Register (FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence.

10	R/W	R	0x0	<p>RemoteWakeupEnable This bit is used by HCD to enable or disable the remote wakeup feature upon the detection of upstream resume signaling. When this bit is set and the ResumeDetected bit in HcInterruptStatus is set, a remote wakeup is signaled to the host system. Setting this bit has no impact on the generation of hardware interrupt.</p>								
9	R/W	R/W	0x0	<p>RemoteWakeupConnected This bit indicates whether HC supports remote wakeup signaling. If remote wakeup is supported and used by the system, it is the responsibility of system firmware to set this bit during POST. HC clear the bit upon a hardware reset but does not alter it upon a software reset. Remote wakeup signaling of the host system is host-bus-specific and is not described in this specification.</p>								
8	R/W	R	0x0	<p>InterruptRouting This bit determines the routing of interrupts generated by events registered in HcInterruptStatus. If clear, all interrupt are routed to the normal host bus interrupt mechanism. If set interrupts are routed to the System Management Interrupt. HCD clears this bit upon a hardware reset, but it does not alter this bit upon a software reset. HCD uses this bit as a tag to indicate the ownership of HC.</p>

This is used by HCD to monitor any persistent scheduling problem.

3	R/W	R/W	0x0	OwnershipChangeRequest This bit is set by an OS HCD to request a change of control of the HC. When set HC will set the OwnershipChange field in <i>HcInterruptStatus</i> . After the changeover, this bit is cleared and remains so until the next request from OS HCD.
2	R/W	R/W	0x0	BulkListFilled This bit is used to indicate whether there are any TDs on the Bulk list. It is set by HCD whenever it adds a TD to an ED in the Bulk list. When HC begins to process the head of the Bulk list, it checks BLF. As long as BulkListFilled is 0, HC will not start processing the Bulk list. If BulkListFilled is 1, HC will start processing the Bulk list and will set BF to 0. If HC finds a TD on the list, then HC will set BulkListFilled to 1 causing the Bulk list processing to continue. If no TD is found on the Bulk list, and if HCD does not set BulkListFilled , then BulkListFilled will still be 0 when HC completes processing the Bulk list and Bulk list processing will stop.

This bit is cleared by HC upon the completion of the reset operation. The reset operation must be completed within 10 ms. This bit, when set, should not cause a reset to the Root Hub and no subsequent reset signaling should be asserted to its downstream ports.</p>

3:0	R	R	0x0	PCED[3:0] Because the general TD length is 16 bytes, the memory structure for the TD must be aligned to a 16-byte boundary. So the lower bits in the PCED, through bit 0 to bit 3 must be zero in this field.

Bit	Read/Write		Default/Hex	Description
	HCD	HC		
31	R/W	R	0x0	FrameIntervalToggler HCD toggles this bit whenever it loads a new value to FrameInterval .
30:16	R/W	R	0x0	FSLargestDataPacket This field specifies a value which is loaded into the Largest Data Packet Counter at the beginning of each frame. The counter value represents the largest amount of data in bits which can be sent or received by the HC in a single transaction at any given time without causing scheduling overrun. The field value is calculated by the HCD.
15:14	/	/	/	/
13:0	R/W	R	0x2edf	FrameInterval This specifies the interval between two consecutive SOFs in bit times. The nominal value is set to be 11,999. HCD should store the current value of this field before resetting HC. By setting the HostControllerReset field of <i>HcCommandStatus</i> as this will cause the HC to reset this field to its nominal value. HCD may choose to restore the stored value upon the completion of the Reset sequence.

9.6.6.14 0x0438 OHCI Frame Remaining Register (Default Value: 0x0000_0000)

	HCD	HC		
31	R	R/W	0x0	FrameRemaining Toggle This bit is loaded from the FrameIntervalToggle field of <i>HcFmInterval</i> whenever FrameRemaining reaches 0. This bit is used by HCD for the synchronization between FrameInterval and FrameRemaining .
30:14	/	/	/	/
13:0	R	RW	0x0	FrameRemaining This counter is decremented at each bit time. When it reaches zero, it is reset by loading the FrameInterval value specified in <i>HcFmInterval</i> at the next bit time boundary. When entering the USBOPERATIONAL state, HC re-loads the content with the FrameInterval of <i>HcFmInterval</i> and uses the updated value from the next SOF.

When entering the USBOPERATIONAL state, this will be incremented automatically. The content will be written to HCCA after HC has incremented the FrameNumber at each frame boundary and sent a SOF but before HC reads the first ED in that Frame. After writing to HCCA, HC will set the StartofFrame in <i>HcInterruptStatus</i> .

9.7 GPIO

9.7.1 Overview

The general purpose input/output (GPIO) is one of the blocks controlling the chip multiplexing pins. The T113-S3 supports 6 groups of GPIO pins. Each pin can be configured as input or output and these pins are used to generate input signals or output signals for special purposes.

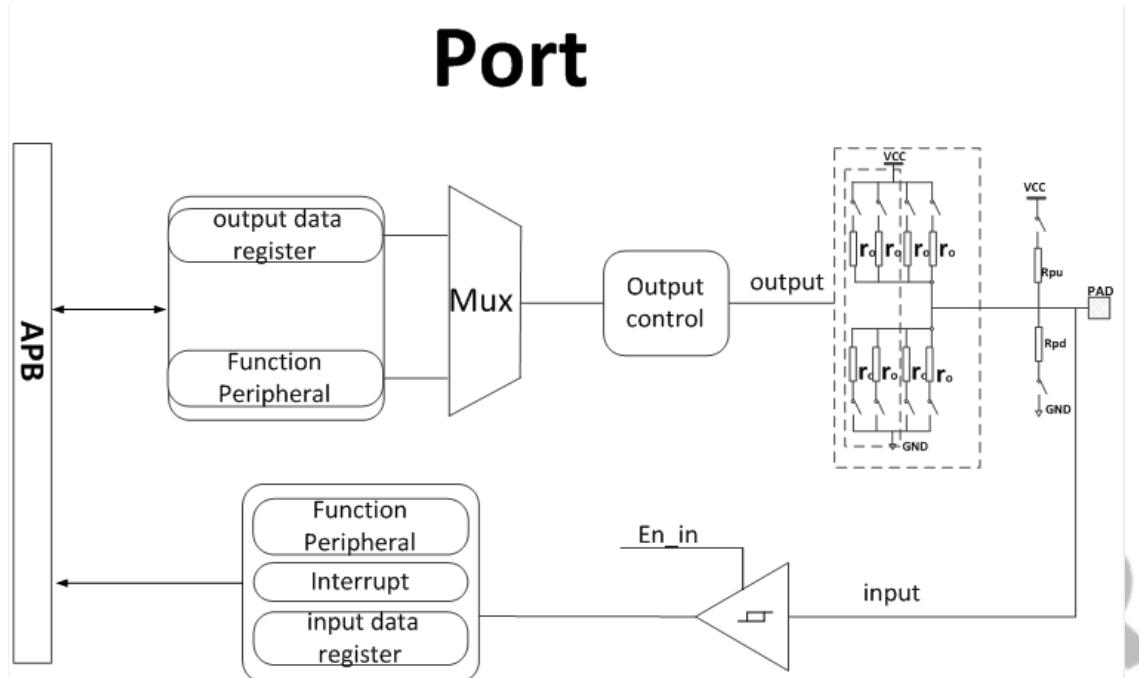

The Port Controller has the following features:

- 6 groups of ports (PB, PC, PD, PE, PF, PG)
- Software control for each signal pin
- Data input (capture)/output (drive)
- Each GPIO peripheral can produce an interrupt
- Pull-up/Pull-down/no-Pull register control
- Control the direction of every signal
- 4 drive strengths in each operating mode
- Up to 72 interrupts
- Configurable interrupt edges

9.7.2 Block Diagram

The following figure shows the block diagram of the GPIO.

Figure 9-67 GPIO Block Diagram

The GPIO consists of the digital part (GPIO, external interface) and IO analog part (output buffer, dual pull down, pad). The digital part can select the output interface by the MUX switch; the analog part can configure pull up/down and buffer strength.

When executing GPIO read state, the GPIO reads the current level of the pin into the internal register bus.

When not executing GPIO read state, the external pin and the internal register bus are off-status, which is high-impedance.

9.7.3 Functional Description

9.7.3.1 Multi-function Port

The T113-S3 includes 72 multi-functional input/output port pins. There are 6 ports as listed below.

Table 9-20 Multi-function Port

Port Name	Number of Pins	Input Driver	Output Driver	Multiplex Pins	Power

9.7.3.2 GPIO Multiplex Function

Table 9-21 to Table 9-26 show the multiplex function pins of the T113-S3.

NOTE

For each GPIO, Function0 is input function; Function1 is output function; Function9 to Function13 are reserved.

9.7.3.3 Port Function

The Port Controller supports 6 GPIOs, every GPIO can configure as Input, Output, Function Peripheral, IO disable or Interrupt function. The configuration instruction of every function is as follows.

Table 9-27 Port Function

	Function	Buffer Strength	Pull Up	Pull Down
Input	GPIO/Multiplexing Input	/	X	X
Output	GPIO/Multiplexing Output	Y	X	X
Disable	Pull Up	/	Y	N
	Pull Down	/	N	Y
Interrupt	Trigger	/	X	X

/: non-configure, configuration is invalid

Y: configure

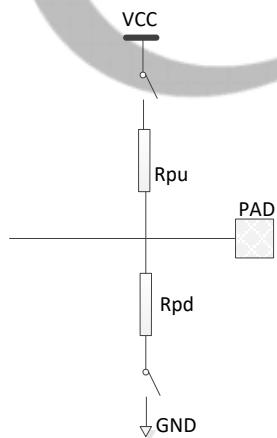

X: Select configuration according to the actual situation

N: Forbid to configure

9.7.3.4 Pull Up/Down and High-Impedance Logic

Each IO pin can configure the internal pull-up/down function or high-impedance.

Figure 9-68 Pull up/down Logic

High-impedance, the output is float state, all buffer is off, the level is decided by external high/low level. When high-impedance, the software configures the switch on Rpu and Rpd as off, and the multiplexing function of IO is set as IO disable or input by software.

Pull-up, an uncertain signal is pulled high by resistance, the resistance has a current-limiting function. When pulling up, the switch on Rpu is conducted by software configuration, the IO is pulled up to VCC by Rpu.

Pull-down, an uncertain signal is pulled low by a resistance. When pulling down, the switch on Rpd is conducted by software configuration, the IO is pulled down to GND by Rpd.

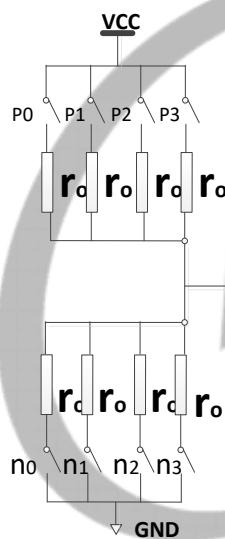

The pull-up/down of each IO is weak pull-up/down.

The setting of pull-down, pull-up, high-impedance is decided by the external circuit.

9.7.3.5 Buffer Strength

Each IO can be set as different buffer strength. The IO buffer diagram is as follows.

Figure 9-69 IO Buffer Strength Diagram

When output high level, the n0, n1, n2, n3 of NMOS is off, the p0, p1, p2, p3 of PMOS is on. When the buffer strength is set to 0 (buffer strength is weakest), only the p0 is on, the output impedance is maximum, the impedance value is r_o . When the buffer strength is set to 1, only the p0 and p1 is on, the output impedance is equivalent to two r_o in parallel, the impedance value is $r_o/2$. When the buffer strength is 2, only the p0, p1, and p2 is on, the output impedance is equivalent to three r_o in parallel, the impedance value is $r_o/3$. When buffer strength is 3, the p0, p1, p2, and p3 is on, the output impedance is equivalent to four r_o in parallel, the impedance value is $r_o/4$.

When output low level, the p0, p1, p2, p3 of PMOS is off, the n0, n1, n2, n3 of NMOS is on. When the buffer strength is set to 0 (buffer strength is weakest), only the n0 is on, the output impedance is maximum, the

impedance value is r_0 . When the buffer strength is set to 1, only the n0 and n1 is on, the output impedance is equivalent to two r_0 in parallel, the impedance value is $r_0/2$. When the buffer strength is 2, only the n0, n1, and n2 is on, the output impedance is equivalent to three r_0 in parallel, the impedance value is $r_0/3$. When the buffer strength is 3, the n0, n1, n2, and n3 is on, the output impedance is equivalent to four r_0 in parallel, the impedance value is $r_0/4$.

When GPIO is set to input or interrupt function, between the output driver circuit and the port is unconnected, the driver configuration is invalid.

The typical value of r_0 is 180Ω .

9.7.3.6 Interrupt

Each group IO has an independent interrupt number. The IO within-group uses one interrupt number when one IO generates interrupt, the GPIO pins sent interrupt request to interrupt module. External Interrupt Status Register is used to query which IO generates interrupt.

The interrupt trigger of GPIO supports the following trigger types.

- Positive Edge: When a low level changes to a high level, the interrupt will generate. No matter how long a high level keeps, the interrupt generates only once.
- Negative Edge: When a high level changes to a low level, the interrupt will generate. No matter how long a low level keeps, the interrupt generates only once.
- High Level: Just keep a high level and the interrupt will always generate.
- Low Level: Just keep a low level and the interrupt will always generate.
- Double Edge: Positive and negative edge.

External Interrupt Configure Register is used to configure the trigger type.

The GPIO interrupt supports hardware debounce function by setting External Interrupt Debounce Register. Sample trigger signal using a lower sample clock, to reach the debounce effect because the dither frequency of the signal is higher than the sample frequency.

Set the sample clock source by PIO_INT_CLK_SELECT and the prescale factor by DEB_CLK_PRE_SCALE.

9.8 GPADC

9.8.1 Overview

The General Purpose ADC (GPADC) can convert the external signal into a certain proportion of digital value, to realize the measurement of analog signal, which can be applied to power detection and key detection. This ADC is a type of successive approximation register (SAR) A/D converter.

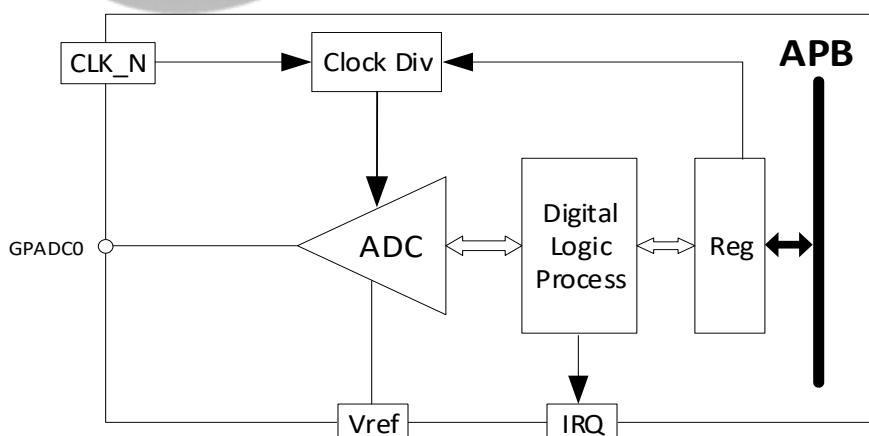

The GPADC has the following features:

- One independent channel
- 12-bit sampling resolution and 8-bit precision
- 64 FIFO depth of data register
- Power reference voltage: AVCC, and analog input voltage range: 0 to AVCC
- Maximum sampling frequency: 1 MHz
- Supports data compare and interrupt
- Supports three operation modes
 - Single conversion mode
 - Continuous conversion mode
 - Burst conversion mode

9.8.2 Block Diagram

Figure 9-70 shows the block diagram of the GPADC.

Figure 9-70 GPADC Block Diagram

9.8.3 Functional Description

9.8.3.1 External Signals

The following table describes the external signals of the GPADC.

Table 9-28 GPADC External Signals

Signal	Description	Type
GPADCO	ADC Input Channel0	AI

9.8.3.2 Clock Sources

The GPADC has one clock source. The following table describes the clock source for GPADC. Users can see section 3.3 “[CCU](#)” for clock setting, configuration, and gating information.

Table 9-29 GPADC Clock Sources

Clock Sources	Description
HOSC	24 MHz

9.8.3.3 GPADC Work Mode

- **Single conversion mode**

The GPADC completes one conversion in a specified channel, the converted data is updated at the data register of the corresponding channel.

- **Continuous conversion mode**

The GPADC has continuous conversion in a specified channel until the software stops, the converted data is updated at the data register of the corresponding channel.

- **Burst conversion mode**

The GPADC samples and converts in a specified channel, and sequentially stores the results in FIFO.

9.8.3.4 Clock and Timing Requirements

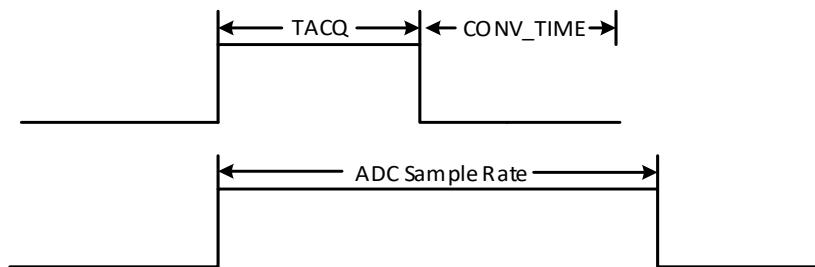

CLK_IN = 24 MHz

CONV_TIME(Conversion Time) = $1/(24\text{MHz}/14\text{Cycles}) = 0.583 \text{ (us)}$

TACQ > 10RC (R is output impedance of ADC sample circuit, C = 6.4 pF)

ADC Sample Frequency > TACQ+CONV_TIME

Figure 9-71 GPADC Clock and Timing Requirement

9.8.3.5 GPADC Calculate Formula

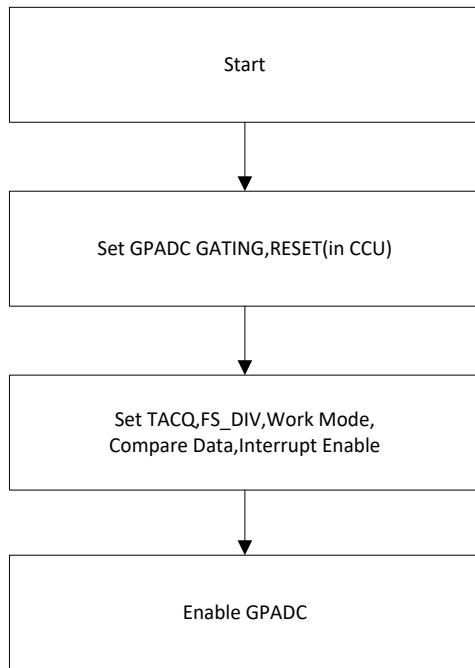

GPADC calculate formula: $\text{GPADC_DATA} = \text{Vin}/V_{\text{REF}} * 4095$

Where:

$V_{\text{REF}} = 1.8 \text{ V}$

9.8.4 Programming Guidelines

The GPADC initial process is as follows.

Figure 9-72 GPADC Initial Process**(1).Query Mode**

- Step 1** Write 0x1 to the bit[16] of [GPADC_BGR_REG](#) to dessert reset.
- Step 2** Write 0x1 to the bit[0] of [GPADC_BGR_REG](#) to enable the GPADC clock.
- Step 3** Write 0x2F to the bit[15:0] of [GP_SR_CON](#) to set the *acquiring time of ADC*.
- Step 4** Write 0x1DF to the bit[31:16] of [GP_SR_CON](#) to set the *ADC sample frequency divider*.
- Step 5** Write 0x2 to the bit[19:18] of [GP_CTRL](#) to set the *continuous conversion mode*.
- Step 6** Write 0x1 to the bit[0] of [GP_CS_EN](#) to enable the *analog input channel*.
- Step 7** Write 0x1 to the bit[16] of [GP_CTRL](#) to enable the ADC function.
- Step 8** Read the bit[0] of [GP_DATA_INTS](#), if the bit is 1, then data conversion is complete.
- Step 9** Read the bit[11:0] of [GP_CHO_DATA](#), and calculate voltage value based on GPADC formula.

(2).Interrupt Mode

- Step 1** Write 0x1 to the bit[16] of [GPADC_BGR_REG](#) to dessert reset.
- Step 2** Write 0x1 to the bit[0] of [GPADC_BGR_REG](#) to enable the GPADC clock.
- Step 3** Write 0x2F to the bit[15:0] of [GP_SR_CON](#) to set the *acquiring time of ADC*.
- Step 4** Write 0x1DF to the bit[31:16] of [GP_SR_CON](#) to set the *ADC sample frequency divider*.
- Step 5** Write 0x2 to the bit[19:18] of [GP_CTRL](#) to set the *continuous conversion mode*.

- Step 6** Write 0x1 to the bit[0] of [GP_CS_EN](#) to enable the *analog input channel*.
- Step 7** Write 0x1 to the bit[0] of [GP_DATA_INTC](#) to enable the GPADC data interrupt.
- Step 8** Set interrupt based on GIC module.
- Step 9** Put interrupt handler address into interrupt vector table.
- Step 10** Write 0x1 to the bit16 of [GP_CTRL](#) to enable the ADC function.
- Step 11** Read the bit[11:0] of [GP_CHO_DATA](#) from the interrupt handler, calculate voltage value based on GPADC formula.

9.9 TPADC

9.9.1 Overview

The Touch Panel ADC (TPADC) is a 4-wire resistive touch screen controller, including a 12-bit SAR type A/D converter.

The TPADC has the following features:

- 12 bit SAR type A/D converter
- Configurable sample frequency up to 1 MHz
- One 32x12 FIFO for storing A/D conversion result
- Supports DMA slave interface
- Supports 4-wire resistive touch panel input detection
 - Supports pen down detection with programmable sensitivity
 - Supports single touch coordinate measurement
 - Supports dual touch detection
 - Supports touch pressure measurement with programmable threshold
 - Supports median and averaging filter for noise reduction
 - Supports X and Y coordinate exchange function
- Supports Aux ADC with up to 4 channels

9.9.2 Functional Description

9.9.2.1 External Signals

The following table describes the external signals of the TPADC.

Table 9-30 TPADC External Signals

Signal	Description	Type
TP-X1	Touch Panel X1 Input	AI
TP-X2	Touch Panel X2 Input	AI
TP-Y1	Touch Panel Y1 Input	AI
TP-Y2	Touch Panel Y2 Input	AI

9.9.2.2 Single-ended Mode and Differential Mode

The controller is a typical type of successive approximation ADC (SAR ADC) which contains a sample/hold, analog-to-digital conversion, serial data output functions.

The analog inputs (X_+ , X_- , Y_+ , Y_-) enter the ADC through the control register, the ADC can work in single-ended or differential mode. Selecting Aux ADC should work in single-ended mode; for a touch screen application, it works in a differential mode, which can effectively eliminate the impact on conversion accuracy caused by the parasitic resistance of the driver switch and external interference.

Figure 9-73 shows TPADC Single-Ended Mode for the measurement of Aux, using the 1.8 V reference source as the ADC reference voltage.

Figure 9-73 TPADC Single-Ended Mode for AUX ADC

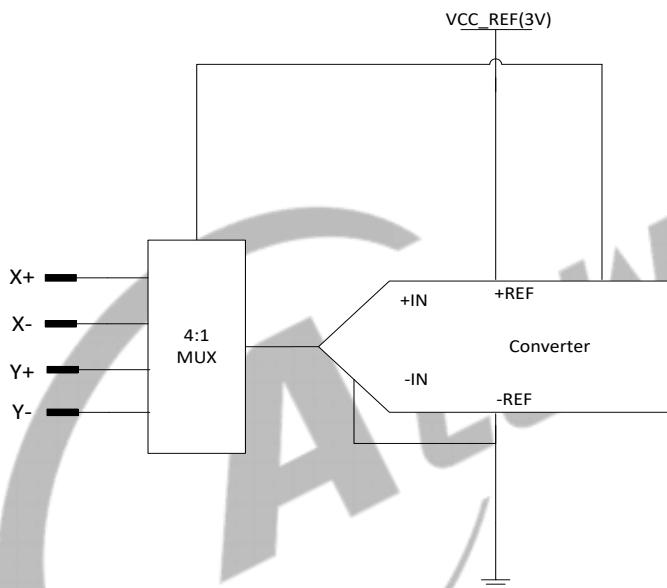

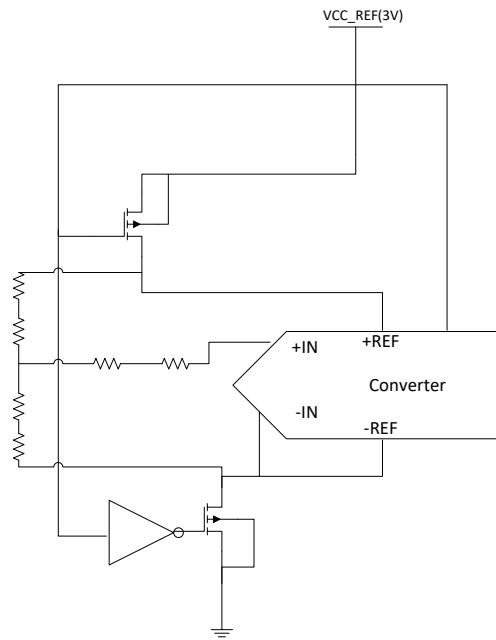

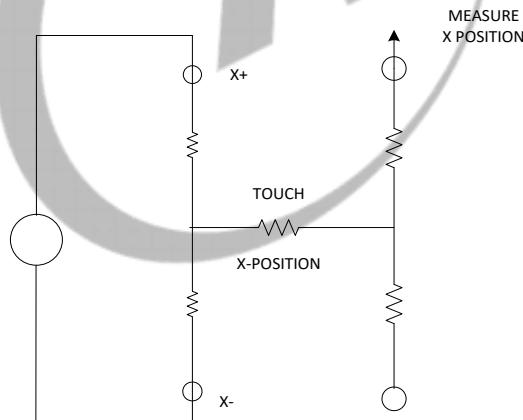

Figure 9-74 shows TPADC differential mode for the measurement of X/Y/Z coordinate of Touch Panel. The advantage of differential mode: +REF and -REF can directly input to the Y_+ and Y_- (or X_+ and X_-), which can eliminate the measurement error of X_+/X_- (or Y_+/Y_-) because of the switch on resistance. The disadvantage is that: both the sample or conversion process, the driver will need to be enabled. Compared with single-ended mode, the power consumption increases.

Figure 9-74 TPADC Differential Mode for Touch Panel

9.9.2.3 Single Touch Measurement

The following figure shows the operation principle of the single touch X-Coordinate measurement.

Figure 9-75 Single Touch X-Coordinate Measurement for Touch Panel

For an X coordinate measurement, the X+ pin is internally switched to VCC_REF and X- to GND. The X plate becomes a potential divider, and the voltage at the point of contact is proportional to its X co-ordinate. This voltage is measured on the Y+, which carries no current (hence there is no voltage drop in RY+ or RY-). Due to the ratio metric measurement method, the supply voltage does not affect measurement accuracy. The voltage

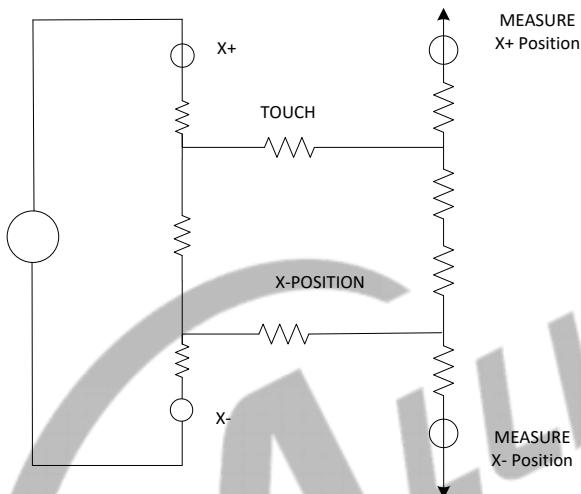

references VREF+ and VREF- are taken from after the matrix switches, so that any voltage drop in these switches has no effect on the ADC measurement.

Y coordinate measurements are similar to X coordinate measurements, with the X and Y plates interchanged.

9.9.2.4 Dual Touch Measurement

In single touch mode, it only needs to test X+ and Y+ signals. But in dual touch mode, it needs to test X+, X-, Y+, and Y- signals. The following figure shows the operation principle of dual touch detection for touch panel.

Figure 9-76 Dual Touch Detection for Touch Panel

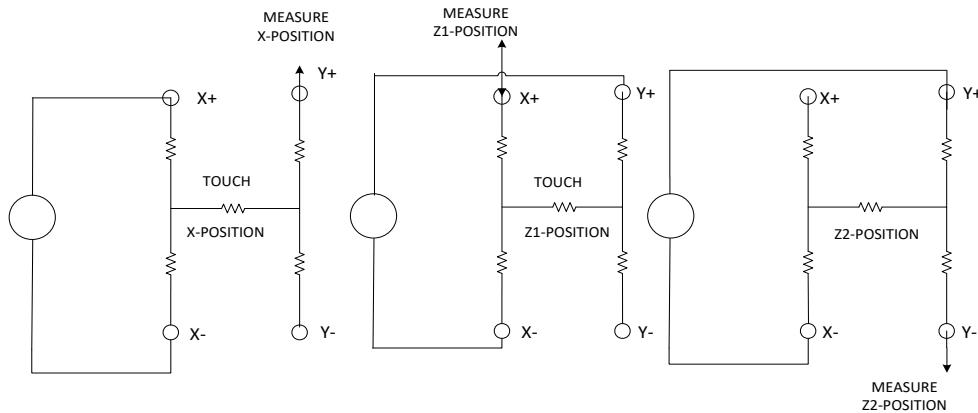

For X coordinates measurement, the X+ pin is internally switched to 3 V and X- to GND. The controller needs to test Y+ and Y-, Y coordinates measurement is similar. And record $\Delta X = |X+ - X-|$, $\Delta Y = |Y+ - Y-|$. In practice, we can set a threshold. If ΔX or ΔY is greater than the threshold, we consider it as a dual touch, otherwise as a single touch.

9.9.2.5 Touch Pressure Measurement

The pressure applied to the touch screen by a pen or finger to filter unavailable can also be measured by the controller using some simple calculations. The contact resistance between the X and Y plates is measured, which provides a good indication of the size of the depressed area and the applied pressure. The area of the touch spot t is proportional to the size of the object touching it. And the value of this resistance (R_{touch}) can be calculated using two different methods.

Figure 9-77 Touch Pressure Measurement for Touch Panel

(1) First Method

The first method requires the user to know the total resistance of the X plate tablet (R_{XPLATE}). Three touch screen conversions are required: measurement of the X position, $X_{POSITION}(Y+ \text{ input})$; measurement of the X+ input with the excitation voltage applied to Y+ and X- (Z1 measurement); and measurement of the Y- input with the excitation voltage applied to Y+ and X- (Z2 measurement). These three measurements are illustrated in following Figure. The controller have two special ADC channel settings to configure the X and Y switches for the Z1 and Z2 measurements and store the results in the Z1 and Z2 result registers. The touch resistance (R_{TOUCH}) can then be calculated using the following equation.

$$R_{TOUCH} = (R_{XPLATE}) \times (X_{POSITION}/4096) \times [(Z2/Z1) - 1]$$

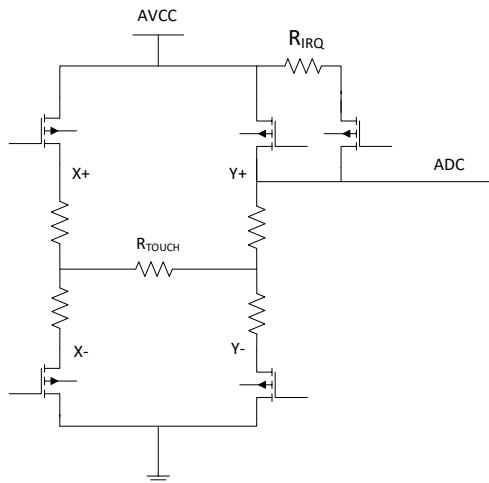

(2) Second Method

The second method requires the user to know the resistance of the X-plate and Y-plate tablets. Three touch screen conversions are required: a measurement of the X position ($X_{POSITION}$), the Y position ($Y_{POSITION}$), and the Z1 position. The following equation also calculates the touch resistance (R_{TOUCH}).

$$R_{TOUCH} = R_{XPLATE} \times (X_{POSITION}/4096) \times [(4096/Z1) - 1] - R_{YPLATE} \times [1 - (Y_{POSITION}/4096)]$$

9.9.2.6 Pen Down Detection

Pen down detection is used as an interrupt to the host. RIRQ is an internal pull-up resistor with a programmable value from 6 kΩ to 96 kΩ (default 48 kΩ).

Figure 9-78 Pen Down Detection for Touch Panel

The pen down IRQ output is pulled high by an internal pull-up. In the pen down detection, the Y– driver is enabled and connected to GND, and the pen down IRQ output is connected to the X+ input. When the panel is touched, the X+ input is pulled to ground through the touch screen, and the pen down IRQ output goes low because of the current path through the panel to GND, initiating an interrupt to the processor.

During the measurement cycle for X-, Y-, and Z-position, the X+ input is disconnected from the pen down IRQ pull-down transistor to eliminate any pull-up resistor leakage current from flowing through the touch screen, thus causing no errors.

9.9.2.7 Median and Averaging Filter

Touch screens are composed of two resistive layers, normally placed over an LCD screen. Because these layers are in close proximity to the LCD screen, noise can be coupled from the screen onto these resistive layers, causing errors in the touch screen positional measurements.

The controller contain a filtering block to process the data and discard the spurious noise before sending the information to the host. The purpose of this block is not only the suppression of noise; the on-chip filtering also greatly reduces the host processing loading.

The processing function consists of two filters that are applied to the converted results: the median filter and the averaging filter. The median filter suppresses the isolated out-of-range noise and sets the number of measurements to be taken. These measurements are arranged in a temporary array, where the first value is the smallest measurement and the last value is the largest measurement. Then the averaging filter size determines the number of values to average. There are four choices which is configured by TP_CTRL3 register (bit 1 and bit 0) to filtrate the ADC sampling data.

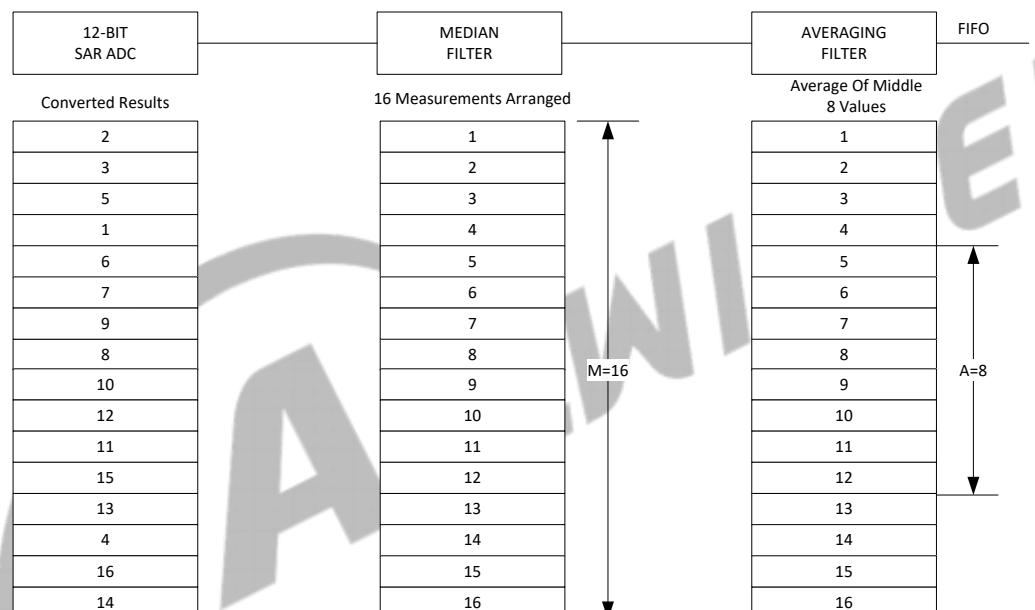

Figure 9-79 Median and Averaging Filter Size

Bit1	Bit0	Averaging Filter Size	Median Filter Size
0	0	2	4

Bit1	Bit0	Averaging Filter Size	Median Filter Size
0	1	3	5
1	0	4	8
1	1	8	16

Example: In this example, the bit[1:0] of TP_CTRL_REG3 is configured as 2'b11. So the median filter has a window size of 16. This means that 16 measurements are taken and arranged in descending order in a temporary array. The averaging window size in this example is 8. The output is the average of the middle eight values of the 16 measurements taken with the median filter.

9.10 PWM

9.10.1 Overview

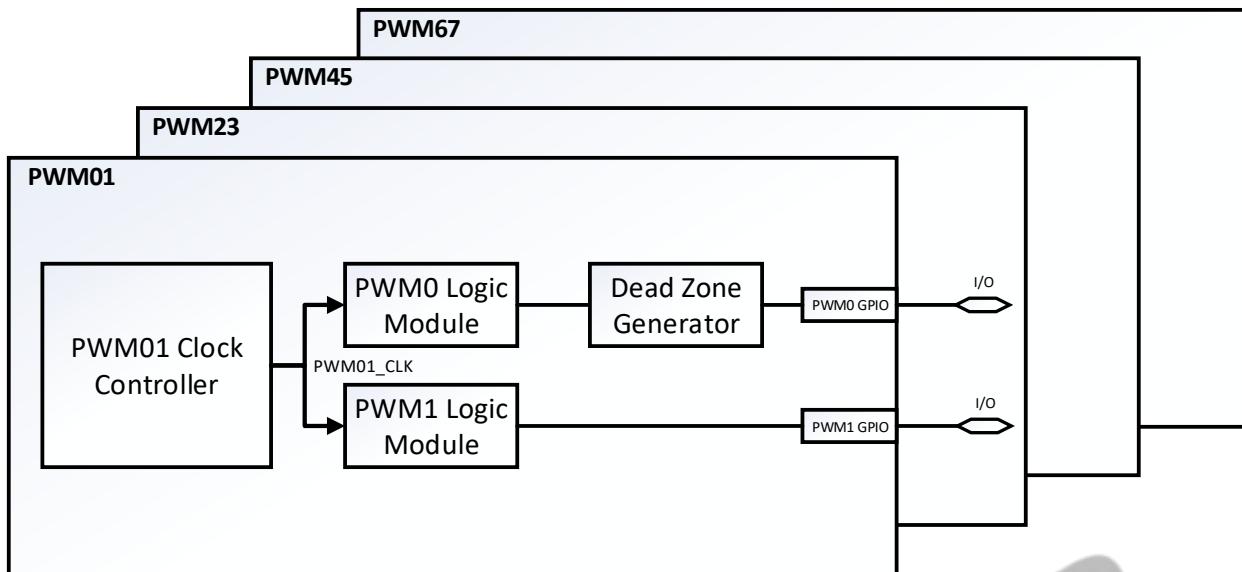

The Pulse Width Modulation (PWM) module can output the configurable PWM waveforms and measure the external input waveforms.

The PWM has the following features:

- Supports 8 independent PWM channels (PWM0 to PWM7)
 - Supports PWM continuous mode output
 - Supports PWM pulse mode output, and the pulse number is configurable
 - Output frequency range: 0 to 24 MHz or 100 MHz
 - Various duty-cycle: 0% to 100%
 - Minimum resolution: 1/65536
- Supports 4 complementary pairs output
 - PWM01 pair (PWM0 + PWM1), PWM23 pair (PWM2 + PWM3), PWM45 pair (PWM4 + PWM5), PWM67 pair (PWM6 + PWM7)
 - Supports dead-zone generator, and the dead-zone time is configurable
- Supports 4 group of PWM channel output for controlling stepping motors
 - Supports any plural channels to form a group, and output the same duty-cycle pulse
 - In group mode, the relative phase of the output waveform for each channel is configurable
- Supports 8 channels capture input
 - Supports rising edge detection and falling edge detection for input waveform pulse
 - Supports pulse-width measurement for input waveform pulse

9.10.2 Block Diagram

The PWM includes multi PWM channels. Each channel can generate different PWM waveform by the independent counter and duty-ratio configuration register. Each PWM pair shares one group of clock and dead-zone generator to generate PWM waveform.

Figure 9-81 PWM Block Diagram

Each PWM pair consists of 1 clock module, 2 timer logic module, and 1 programmable dead-zone generator.

PWM7	Pulse Width Module Channel7	I/O

9.10.3.2 Typical Application

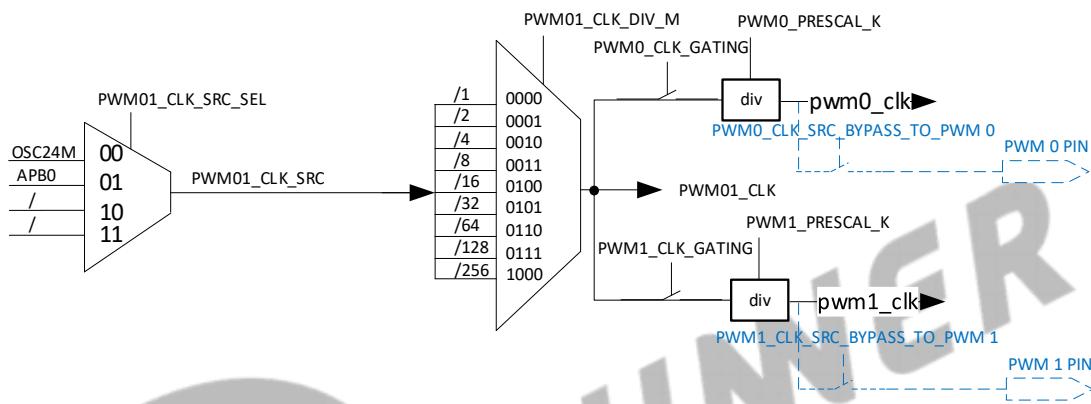

- Suitable for display device, such as LCD

- Suitable for electric motor control

9.10.3.3 Clock Controller

Using PWM01 as an example. The other PWM pairs are the same as PWM01.

Figure 9-82 PWM01 Clock Controller Diagram

The clock controller of each PWM pair includes clock source select ([PWM01_CLK_SRC](#)), 1~256 scaler ([PWM01_CLK_DIV_M](#)). Each PWM channel has the secondary frequency division ([PWM_PRESCAL_K](#)), clock source bypass ([PWMx_CLK_BYPASS](#)) and clock switch ([PWMx_CLK_GATING](#)).

The clock sources have HOSC and APBO. The HOSC comes from the external high-frequency oscillator; the APBO is APBO bus clock.

The bypass function of the clock source is that the clock source directly accesses PWM output, the PWM output waveform is the waveform of the clock controller output. The BYPASS gridlines in the above figure indicate the bypass function of the clock source, see Figure 9-83 for the details about implement. At last, the output clock of the clock controller is sent to the PWM logic module.

9.10.3.4 PWM Output

Taking PWM01 as an example, Figure 9-83 indicates the PWM01 output logic diagram. The logic diagrams of other PWM pairs are the same as PWM01.

The timer logic module of PWM consists of one 16-bit up-counter ([PCNTR](#)) and three 16-bit parameters ([PWM_ENTIRE_CYCLE](#), [PWM_ACT_CYCLE](#), [PWM_COUNTER_START](#)). The [PWM_ENTIRE_CYCLE](#) is used to

control the PWM cycle, the [PWM_ACT_CYCLE](#) is used to control the duty-cycle, the [PWM_COUNTER_START](#) is used to control the output phase (multi-channel synchronization work requirements).

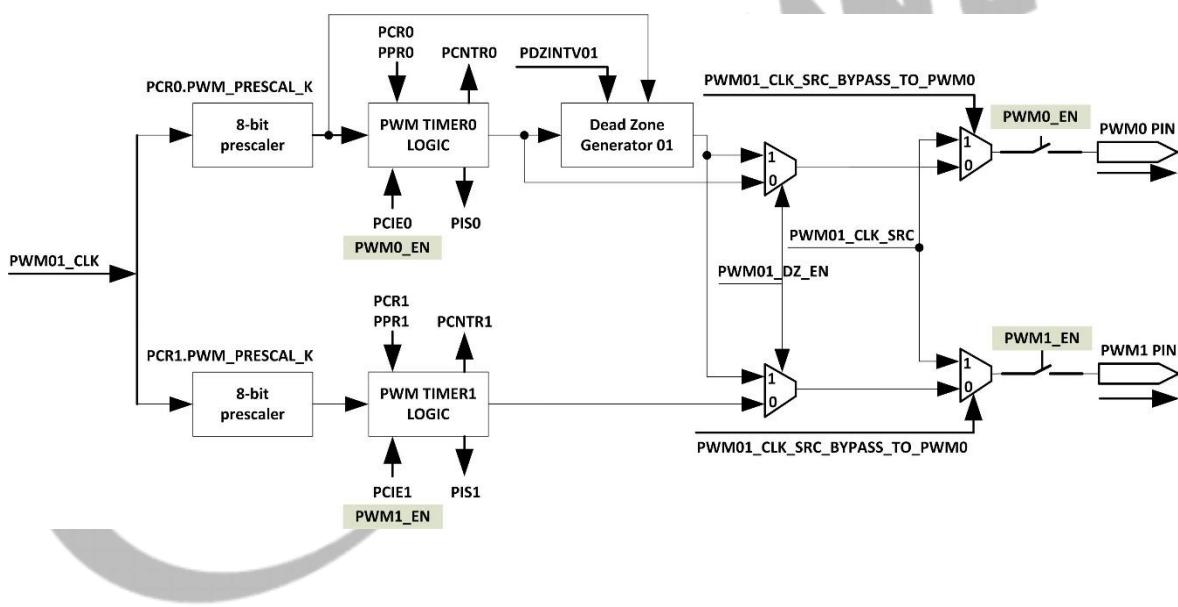

The [PWM_ENTIRE_CYCLE](#) and the [PWM_ACT_CYCLE](#) support the cache load, after PWM output is enabled, the register values of the [PWM_ENTIRE_CYCLE](#) and the [PWM_ACT_CYCLE](#) can be changed anytime, the changed value caches into the cache register. When the PCNTR counter outputs a period of PWM waveform, the value of the cache register can be updated for the PCNTR control. The purpose of the cache load is to avoid the unstable PWM output waveform with the burred feature when updating the values of the [PWM_ENTIRE_CYCLE](#) and [PWM_ACT_CYCLE](#).

The PWM supports cycle and pulse waveform output.

Cycle mode: The PWM outputs the setting PWM waveform continually, that is, the output waveform is a continuous PWM square wave.

Pulse mode: After setting the [PWM_PUL_NUM](#) parameter, the PWM outputs ([PWM_PULNUM+1](#)) periods of PWM waveform, that is, the waveform with several pulses are output.

Figure 9-83 PWM01 Output Logic Module Diagram

9.10.3.5 Up-Counter and Comparator

The period, duty-cycle, and phase of PWM output waveform are decided by the [PCNTR](#), [PWM_ENTIRE_CYCLE](#), [PWM_ACT_CYCLE](#), and [PWM_COUNTER_START](#). The rules are as follows.

- $\text{PCNTR} = (\text{PCNTR} == \text{PWM_ENTIRE_CYCLE}) ? 0 : \text{PCNTR} + 1$
- PCNTR starts to count by [PWM_COUNTER_START](#), the counter of a PWM period is ([PWM_ENTIRE_CYCLE+1](#)).
- $\text{PCNTR} > (\text{PWM_ENTIRE_CYCLE} - \text{PWM_ACT_CYCLE})$, output “active state”

- PCNTR <= (PWM_ENTIRE_CYCLE - PWM_ACT_CYCLE), output “~ (active state)”

Active state of PWM0 channel is high level (PCR0. PWM_ACT_STA = 1)

When PCNTR0 > (PPR0. PWM_ENTIRE_CYCLE - PPR0.PWM_ACT_CYCLE), then PWM0 outputs 1 (high level).

When PCNTR0 <= (PPR0. PWM_ENTIRE_CYCLE - PPR0.PWM_ACT_CYCLE), then PWM0 outputs 0 (low level).

The formula of the output period and the duty-cycle for PWM are as follows.

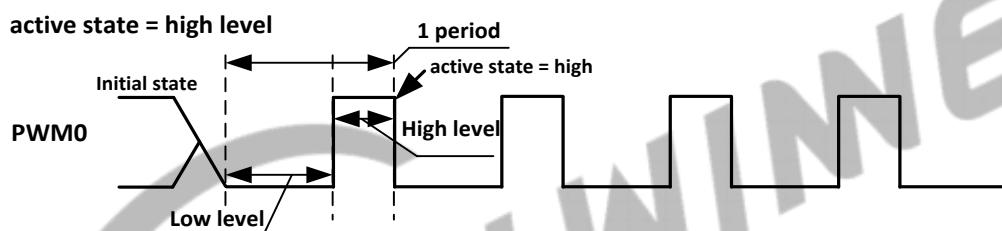

$$T_{\text{period}} = (\text{PWM01_CLK} / \text{PWM0_PREScale_K})^{-1} * (\text{PPR0.PWM_ENTIRE_CYCLE} + 1)$$

$$T_{\text{high-level}} = (\text{PWM01_CLK} / \text{PWM0_PREScale_K})^{-1} * \text{PPR0.PWM_ACT_CYCLE}$$

$$T_{\text{low-level}} = (\text{PWM01_CLK} / \text{PWM0_PREScale_K})^{-1} * (\text{PPR0.PWM_ENTIRE_CYCLE} + 1 - \text{PPR0.PWM_ACT_CYCLE})$$

$$\text{Duty-cycle} = (\text{high level time}) / (\text{1 period time}) = T_{\text{high-level}} / T_{\text{period}}$$

Figure 9-84 PWM0 High Level Active State

Active state of PWM0 channel is low level (PCR0. PWM_ACT_STA = 0)

When PCNTR0 > (PPR0.PWM_ENTIRE_CYCLE - PPR0.PWM_ACT_CYCLE), then PWM0 outputs 0.

When PCNTR0 <= (PPR0.PWM_ENTIRE_CYCLE - PPR0.PWM_ACT_CYCLE), then PWM0 outputs 1.

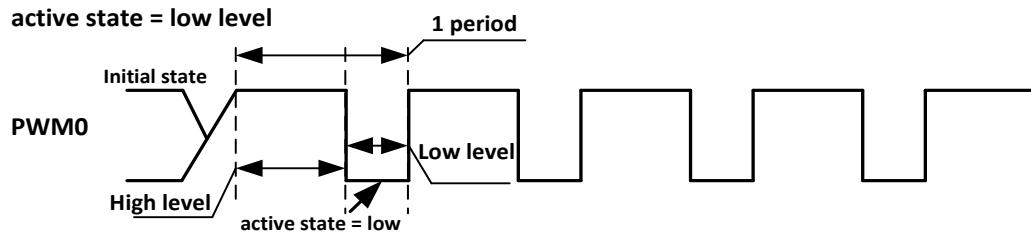

The formula of the output period and the duty-cycle for PWM are as follows.

$$T_{\text{period}} = (\text{PWM01_CLK} / \text{PWM0_PREScale_K})^{-1} * (\text{PPR0.PWM_ENTIRE_CYCLE} + 1)$$

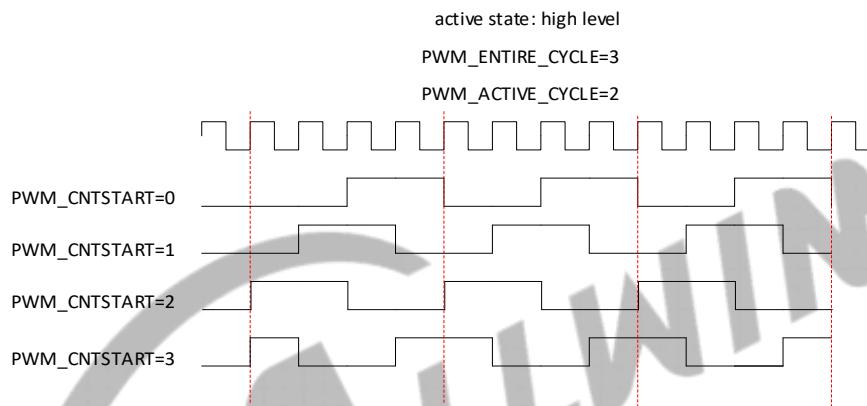

$$T_{\text{high-level}} = (\text{PWM01_CLK} / \text{PWM0_PREScale_K})^{-1} * (\text{PPR0.PWM_ENTIRE_CYCLE} + 1 - \text{PPR0.PWM_ACT_CYCLE})$$

$$T_{\text{low-level}} = (\text{PWM01_CLK} / \text{PWM0_PREScale_K})^{-1} * \text{PPR0.PWM_ACT_CYCLE}$$

$$\text{Duty-cycle} = (\text{low level time}) / (\text{1 period time}) = T_{\text{low-level}} / T_{\text{period}}$$

Figure 9-85 PWM0 Low Level Active State

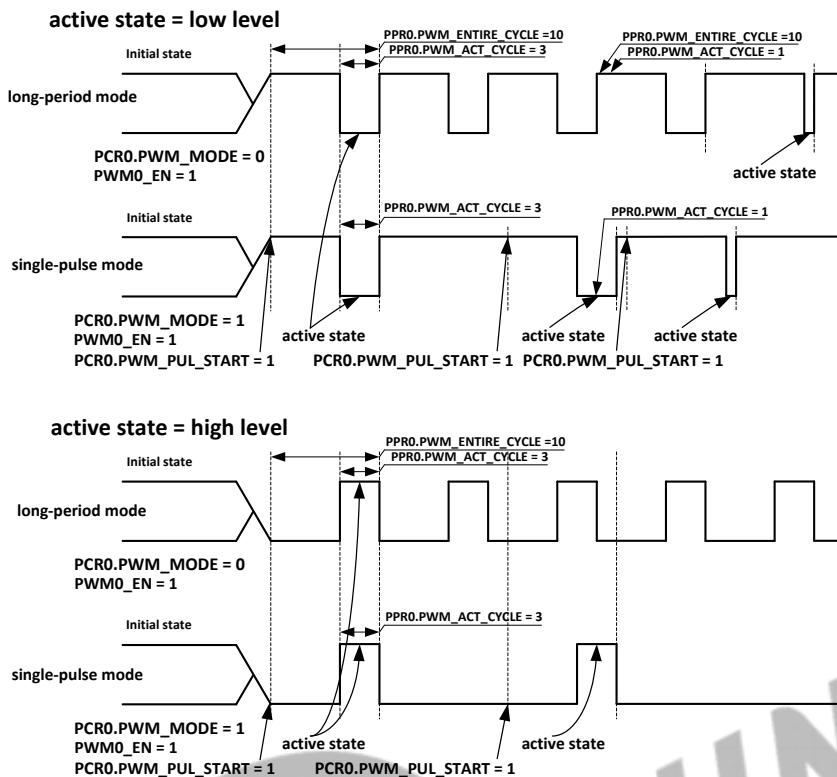

The counter of PCNTR starts from 0 by default, it can output the pulse control of the waveform by setting [PWM_COUNTER_START](#). The figure is as follows.

Figure 9-86 Phase of PWM0 High Level Active State

9.10.3.6 Pulse Mode and Cycle Mode

The PWM output supports pulse mode and cycle mode. PWM in pulse mode outputs one pulse waveform, but PWM in cycle mode outputs continuous waveform. Figure 9-87 shows the PWM output waveform in pulse mode and cycle mode.

Figure 9-87 PWM0 Output Waveform in Pulse Mode and Cycle Mode

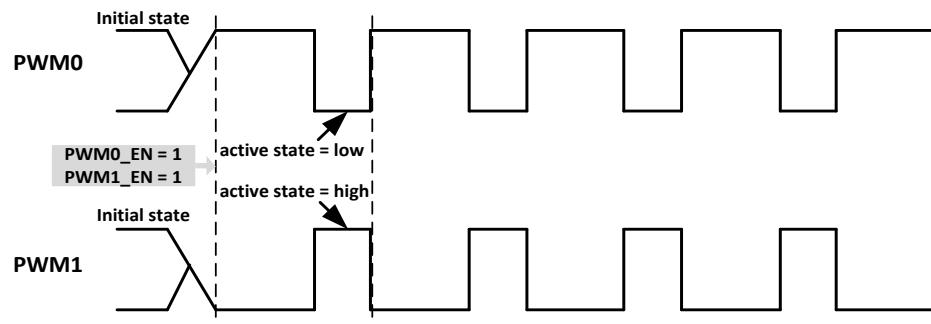

Each channel of the PWM module supports the PWM output of pulse mode and cycle mode, the active state of the PWM output waveform can be programmed to control.

When [PCR0\[PWM_MODE\]](#) is 0, the PWMO outputs in cycle mode. When [PCR0\[PWM_MODE\]](#) is 1, the PWMO outputs in pulse mode.

Specifically, in pulse mode, after the PWMO channel enabled, [PCR0\[PWM_PUL_START\]](#) needs to be set to 1 when the PWMO needs to output pulse waveform, after completed the output, [PCR0\[PWM_PUL_START\]](#) can be cleared to 0 by hardware. The next setting 1 can be operated after [PCR0\[PWM_PUL_START\]](#) is cleared.

9.10.3.7 Complementary Pair Output

Every PWM pair supports complementary pair output and PWM pair with dead-time. Figure 9-88 shows the complementary pair output of PWM01.

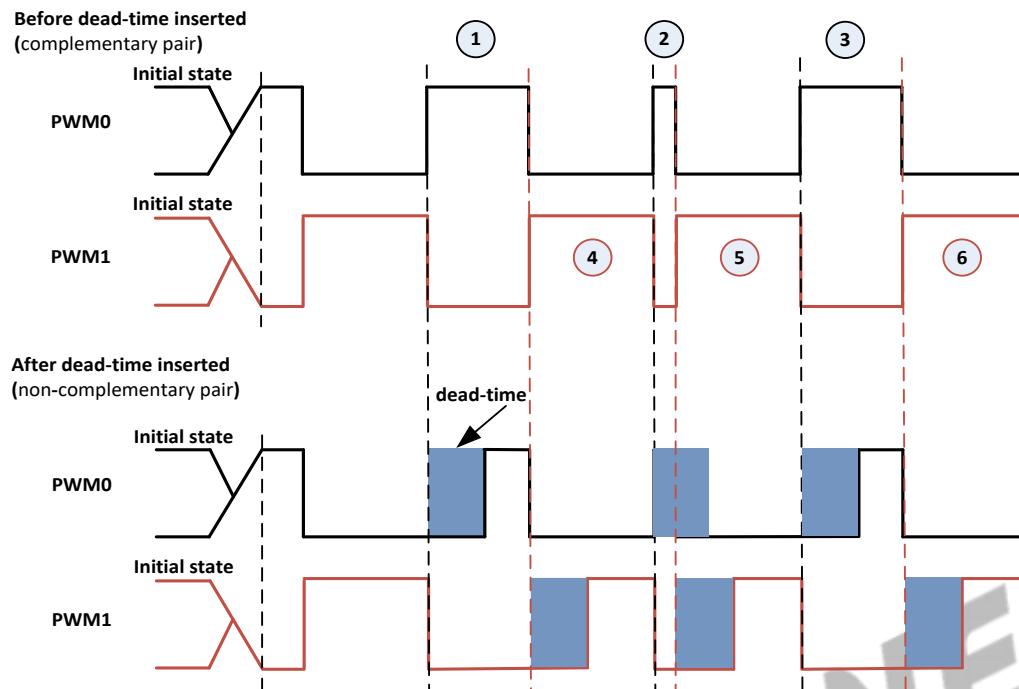

Figure 9-88 PWM01 Complementary Pair Output

The complementary pair output needs to satisfy the following conditions:

- PWM0 and PWM1 have the same clock divider, frequency, duty-cycle, and phase
- PWM0 and PWM1 have an opposite active state
- Enable the clock gating of PWM0 and PWM1 at the same time
- Enable the waveform output of PWM0 and PWM1 at the same time

9.10.3.8 Dead-time Generator

Every PWM pair has a programmable dead-time generator. When the dead-time function of the PWM pair is enabled, the PWM01 output waveform is decided by PWM timer logic and DeadZone Generator. Figure 9-89 shows the output waveform.

Figure 9-89 Dead-time Output Waveform

The PWM waveform before the insertion of dead-time indicates a complementary waveform pair of non-inserted dead-time in Dead Zone Generator 01.

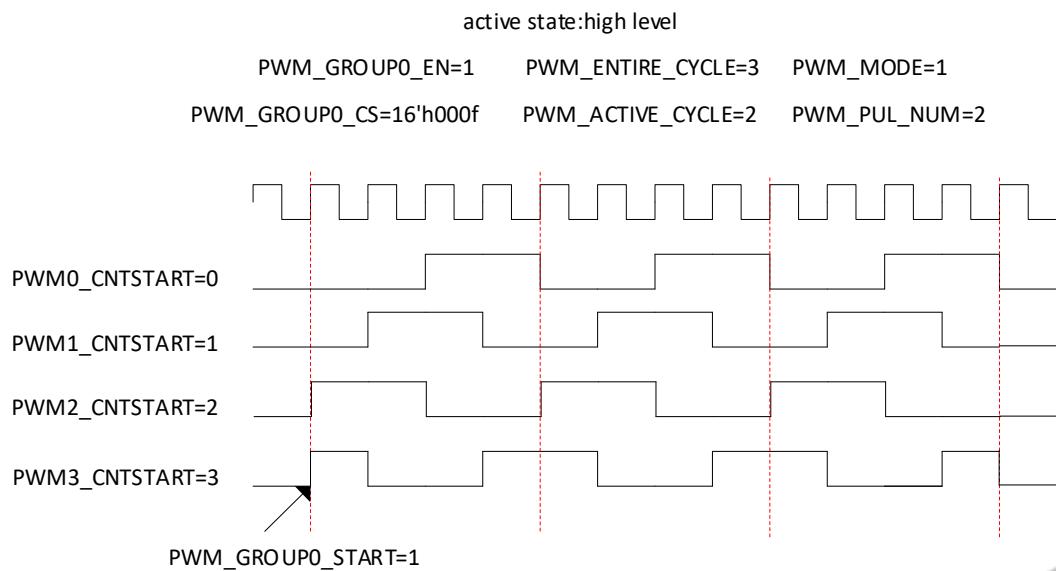

The PWM waveform after the insertion of dead-time indicates a non-complementary PWM waveform pair inserted dead-time in a complementary waveform pair of Dead Zone Generator 01. The PWM waveform pair at last outputs to PWM0 pin and PWM1 pin.

For the complementary pair of Dead Zone Generator 01, the principle of inserting dead-time is that to insert dead-time as soon as the rising edge came. If the high level time for mark② in the above figure is less than dead-time, then dead-time will override the high level. The setting of dead-time needs to consider the period and the duty-cycle of the output waveform. The dead-time formula is defined as follows:

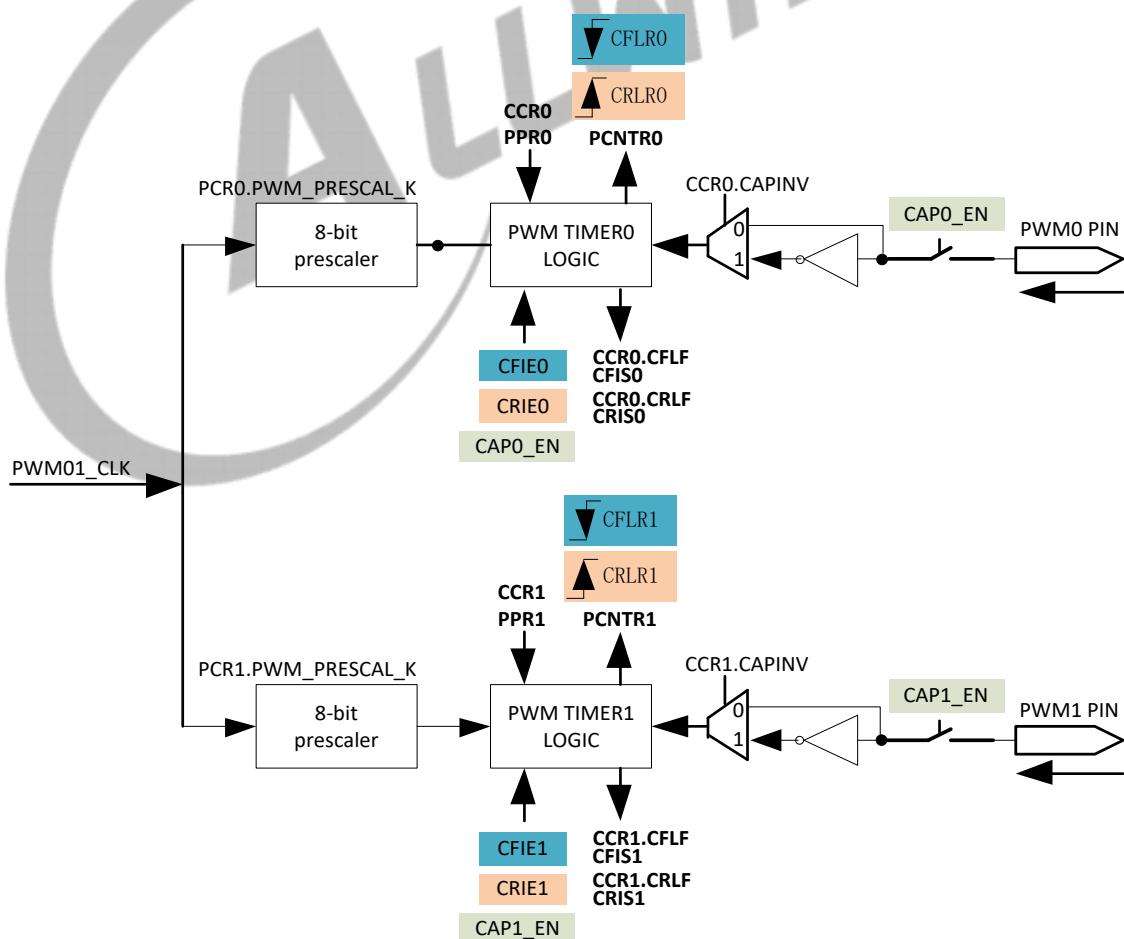

$$\text{Dead-time} = (\text{PWM01_CLK} / \text{PWM0_PRESCALE_K})^{-1} * \text{PDZINTV01}$$

9.10.3.9 PWM Group Mode

Taking PWM Group0 as an example. The same group of PWM channel is selected to work by PGR0.CS; the same [PWM_ENTIRE_CYCLE](#), [PWM_ACT_CYCLE](#) are set by the same clock configuration; the different [PWM_COUNTER_START](#) can output PWM group signals with the same duty-cycle and the different phase.

Figure 9-90 Group 0–3 PWM Signal Output

9.10.3.10 Capture Input

Figure 9-91 PWM01 Capture Logic Module Diagram

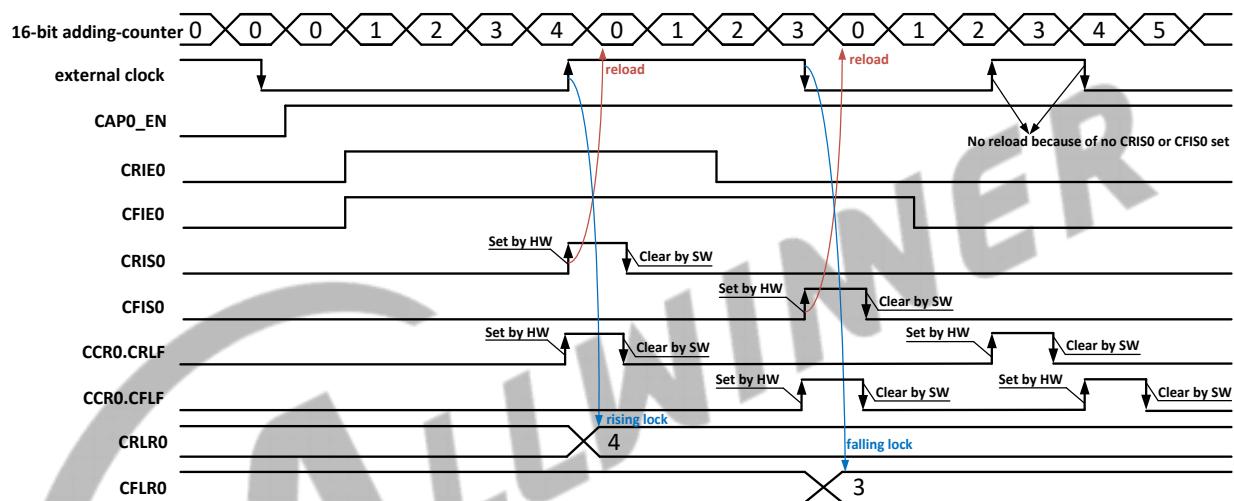

Besides the timer logic module of every PWM channel generates PWM output, it can be used to capture the rising edge and the falling edge of the external clock. Using the PWM0 channel as an example, the PWM0 channel has one [CFLR0](#) and one [CRLR0](#) for capturing up-counter value on the falling edge and rising edge, respectively. You can calculate the period of the external clock by [CFLR0](#) and [CRLR0](#).

$$T_{\text{high-level}} = (\text{PWM01_CLK} / \text{PWM0_PRESCALE_K})^{-1} * \text{CRLR0}$$

$$T_{\text{low-level}} = (\text{PWM01_CLK} / \text{PWM0_PRESCALE_K})^{-1} * \text{CFLR0}$$

$$T_{\text{period}} = T_{\text{high-level}} + T_{\text{low-level}}$$

Figure 9-92 PWM0 Channel Capture Timing

When the capture input function of the PWM0 channel is enabled, the PCNTR of the PWM0 channel starts to work.

When the timer logic module of PWM0 captures a rising edge, the current value of the up-counter is locked to [CRLR0](#) and [CCR0\[CRLF\]](#) is set to 1. If [CRIE0](#) is 1, then [CRISO](#) is set to 1, the PWM0 channel sends interrupt requests, and the up-counter is loaded to 0 and continues to count. If [CRIE0](#) is 0, the timer logic module of PWM0 captures a rising edge, [CRISO](#) cannot be set to 1, the up-counter is not loaded to 0.

When the timer logic module of PWM0 captures one falling edge, the current value of PCNTR is locked to [CFLR0](#) and [CCR0\[CFLF\]](#) is set to 1. If [CFIE0](#) is 1, then [CFISO](#) is set to 1, the PWM0 channel sends interrupt requests, and the up-counter is loaded to 0 and continues to count. If [CFIE0](#) is 0, the timer logic module of PWM0 captures a falling edge, [CFISO](#) cannot be set to 1, the up-counter is not loaded to 0.

9.10.3.11 Interrupt

The PWM supports an interrupt generation when configuring the PWM channel to PWM output or capturing input.

For PWM output function, when the controller outputs one period of PWM waveform in cycle mode, the PIS of the corresponding PWM channel is set to 1; when the controller outputs (PWM_PULNUM+1) periods of PWM waveform in pulse mode, the PIS of the corresponding PWM channel is set to 1.

The PIS bit is set to 1 automatically by hardware and cleared by software.

For capturing input function, when the timer logic module of the capture channel0 captures rising edge, and CRIE0 is 1, then CRISO is set to 1; when the timer logic module of the capture channel0 captures falling edge, and CFIE0 is 1, then CFISO is set to 1.

9.10.4 Programming Guidelines

The following working mode takes PWM01 as an example, other PWM pairs and PWM01 are consistent.

9.10.4.1 Configuring Clock

- Step 1** PWM gating: When using PWM, write 1 to PCGR[PWMx_CLK_GATING].
- Step 2** PWM clock source select: Set PCCR01[PWM01_CLK_SRC] to select HOSC or APB0 clock.
- Step 3** PWM clock divider: Set PCCR01[PWM01_CLK_DIV_M] to select different frequency division coefficient (1/2/4/8/16/32/64/128/256).
- Step 4** PWM clock bypass: Set PCGR[PWM_CLK_SRC_BYPASS_TO_PWM] to 1, output the PWM clock after the secondary frequency division to the corresponding PWM output pin.
- Step 5** PWM internal clock configuration: Set PCR[PWM_PRESCAL_K] to select any frequency division coefficient from 1 to 256.

For the channel of complementary output and group mode, firstly, set the same clock configurations (clock source selects APB0, clock division configures the same division factor); secondly, open clock gating at the same time; thirdly, configure PWM parameters; finally, enable PWM output at the same time to ensure each channel sync.

We suggest that the two channels of the same PWM pair cannot subject to two groups because of they have the same first level clock division and gating. If must allocate based on this way, the first level of clock division of the channel used by all groups needs to set to the same coefficient and open gating at the same time. And the total module needs to be reset when the group mode regroups.

9.10.4.2 Configuring PWM

- Step 1** PWM mode: Set [PCR\[PWM_MODE\]](#) to select cycle mode or pulse mode, if pulse mode, [PCR\[PWM_PUL_NUM\]](#) needs to be configured.
- Step 2** PWM active level: Set [PCR\[PWM_ACT_STA\]](#) to select a low level or high level.
- Step 3** PWM duty-cycle: Configure [PPR\[PWM_ENTIRE_CYCLE\]](#) and [PPR\[PWM_ACT_CYCLE\]](#) after clock gating is opened.
- Step 4** PWM starting/stopping phase: Configure [PCNTR\[PWM_COUNTER_START\]](#) after the clock gating is enabled and before the PWM is enabled. You can verify whether the configuration was successful by reading back [PCNTR\[PWM_COUNTER_STATUS\]](#).
- Step 5** Enable PWM: Configure PER to select the corresponding PWM enable bit; when selecting pulse mode, [PCR\[PWM_PUL_START\]](#) needs to be enabled.

9.10.4.3 Configuring Deadzone

- Step 1** Set initial value: set [C:\Users\zengjing\Downloads\ PWM01_Dead_Zone - Hlk49450444C:\Users\zengjing\Downloads\ PWM01_Dead_Zone - Hlk49450444\[PDZINTV01\]](#).
- Step 2** Enable Deadzone: set [C:\Users\zengjing\Downloads\ PWM01_Dead_Zone - Hlk49450444C:\Users\zengjing\Downloads\ PWM01_Dead_Zone - Hlk49450444\[PWM01_DZ_CN\]](#).

9.10.4.4 Configuring Capture Input

- Step 1** Enable capture: Configure [CER](#) to enable the corresponding channel.
- Step 2** Capture mode: Configure [CCR\[CRLF\]](#) and [CCR\[CFLF\]](#) to select rising edge capture or falling edge capture, configure [CCR\[CAPINV\]](#) to select whether the input signal does reverse processing.

9.11 LEDC

9.11.1 Overview

The LEDC is used to control the external LED lamp.

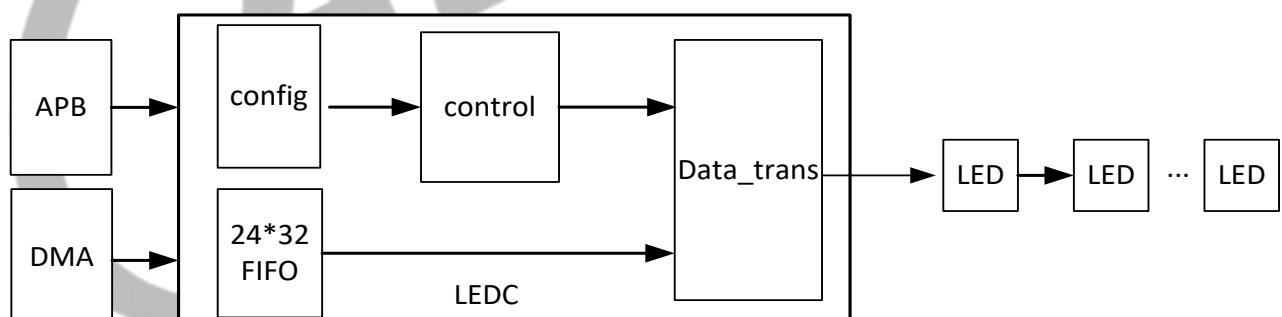

The LEDC has the following features:

- Configurable LED output high-/low-level width
- Configurable LED reset time
- LEDC data supports DMA configuration mode and CPU configuration mode
- Maximum 1024 LEDs serial connect
- LED data transfer rate up to 800 kbit/s
- Configurable RGB display mode
- The default level of non-data output is configurable

9.11.2 Block Diagram

The following figure shows a block diagram of the LEDC.

Figure 9-93 LEDC Block Diagram

LEDC contains the following sub-blocks:

Table 9-32 LEDC Sub-blocks

Sub-block	Description
config	register configuration
control	LEDC timing control and status control
FIFO	24-bit width x 32 depth
Data_trans	Convert input data to the 0 and 1 characters of LED

9.11.3.9 LEDC Parameter

1. PAD rate > 800 kbit/s
2. LED number supported:

$T_0\text{-code}$: 800 ns to 1980 ns, $T_1\text{-code}$: 800 ns to 2020 ns

When the LED refresh rate is 30 frame/s, LED number supported is $(1 \text{ s}/30\text{-}280 \text{ us})/((800 \text{ ns to } 2020 \text{ ns})^{\ast}24)$
=1024 ↳ to 681.

When the LED refresh rate is 60 frame/s, LED number supported is $(1 \text{ s}/60\text{-}280 \text{ us})/((800 \text{ ns to } 2020 \text{ ns})^{\ast}24)$
=853 ↳ to 338.

9.11.3.10 LEDC Data Transfer

The LEDC supports DMA data transfer mode or CPU data transfer mode. The DMA data transfer mode is set by LEDC_DMA_EN

Data transfer in DMA mode

When the valid space of internal FIFO is greater than the setting FIFO free space threshold, the LEDC sends DMA_REQ to require DMA to transfer data from DRAM to LEDC. The maximum data transfer size in DMA mode is 16 words. (The internal FIFO level is 32.)

Data transfer in CPU mode

When the valid space of internal FIFO is greater than the setting FIFO free space threshold, the LEDC sends LEDC_CPUREQ_INT to require CPU to transfer data to LEDC. The transfer data size in CPU mode is controlled by software. The internal FIFO destination address is 0x06700014. The data width is 32-bit. (The lower 24-bit is valid.)

9.11.3.11 LEDC Interrupt

Module Name	Description
FIFO_OVERFLOW_INT	FIFO overflow interrupt. The data written by external is more than the maximum storage space of LED FIFO, the LEDC will be in data loss state. At this time, software needs to deal with the abnormal situation. The processing mode is as follows. The software can query LED_FIFO_DATA_REG to determine which data has been stored in the internal FIFO of LEDC. The LEDC performs soft_reset operation to refresh all data.

Module Name	Description
WAITDATA_TIMEOUT_INT	Wait for data timeout interrupt When internal FIFO of LEDC cannot get data because of some abnormal situation, the timeout interrupt is set after led_wait_data_time, now the LEDC is in WAIT_DATA state, and the LEDC outputs a level state configured by LED_POLARITY; in the course of wait_data, if the new data arrives, the LEDC will continue to send data, at this time the software needs to notice whether the waiting time of the LEDC exceeds the operation time of reset. If the waiting time of the LEDC exceeds the operation time of reset (this is equivalent to reset operation sent by LEDC), the LED may enter in refresh state, the data has not been sent.
FIFO_CPUREQ_INT	FIFO request CPU data interrupt When FIFO data is less than a threshold, the interrupt will be reported to the CPU.
LEDC_TRANS_FINISH_INT	Data transfer complete interrupt The value indicates that the data configured as total_data_length has been transferred completely.

LEDC interrupt usage scenario:

CPU mode

The software can enable GLOBAL_INT_EN, FIFO_CPUREQ_INT_EN, WAITDATA_TIMEOUT_INT_EN, FIFO_OVERFLOW_INT_EN, LEDC_TRANS_FINISH_INT_EN, and cooperate with LEDC_FIFO_TRIG_LEVEL to use. When FIFO_CPUREQ_INT is set to 1, the software can configure data of LEDC_FIFO_TRIG_LEVEL to LEDC.

DMA mode

The software can enable GLOBAL_INT_EN, WAITDATA_TIMEOUT_INT_EN, FIFO_OVERFLOW_INT_EN, LEDC_TRANS_FINISH_INT_EN, and cooperate with LEDC_FIFO_TRIG_LEVEL to use. When DMA receives LEDC_DMA_REQ, DMA can transfer data of LEDC_FIFO_TRIG_LEVEL to LEDC.

9.11.4 Programming Guidelines

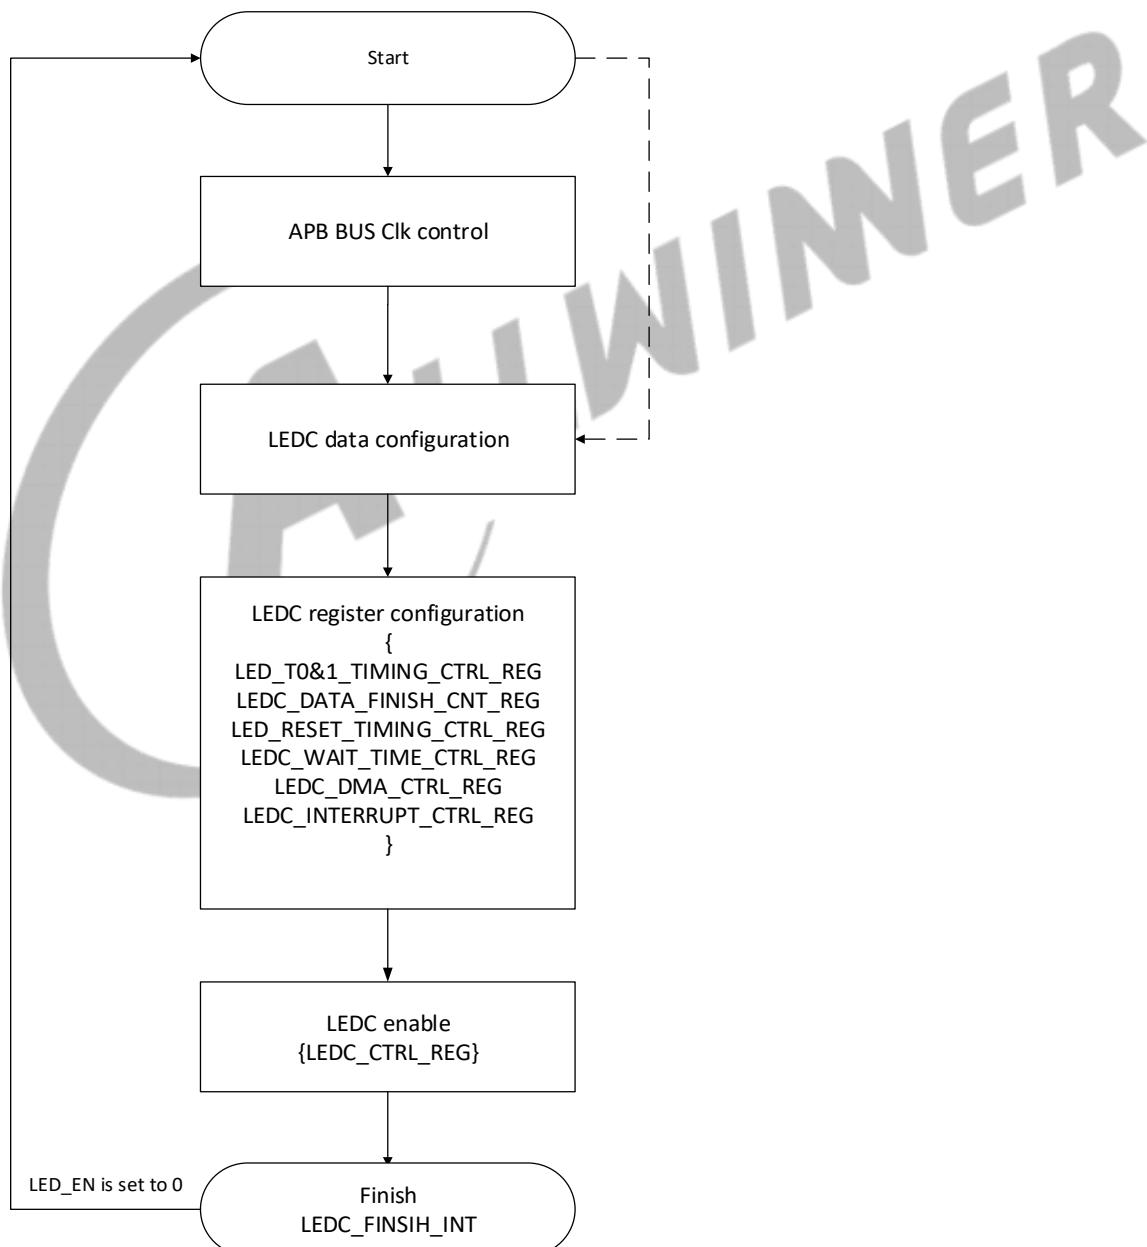

9.11.4.1 LEDC Normal Configuration Process

Step 1 Configure LEDC_CLK and bus pclk.

Step 2 Configure the written LEDC data.

- Step 3** Configure [LED_T01_TIMING_CTRL_REG](#), [LEDC_DATA_FINISH_CNT_REG](#),
[LED_RESET_TIMING_CTRL_REG](#), [LEDC_WAIT_TIMEO_CTRL_REG](#), [LEDC_DMA_CTRL_REG](#),
[LEDC_INTERRUPT_CTRL_REG](#). Configure 0-code, 1-code, reset time, LEDC waiting time, and the number of external connected LEDC and the threshold of DMA transfer data.
- Step 4** Configure [LEDC_CTRL_REG](#) to enable LEDC_EN, the LEDC will start to output data.
- Step 5** When the LEDC interrupt is pulled up, it indicates the configured data has transferred complete, at this time LED_EN will be set to 0, and the read/write point of LEDC FIFO is cleared to 0.
- Step 6** Repeat step1, 2, 3, 4 to re-execute a new round of configuration, enable LEDC_EN, the LEDC will start new data transfer.

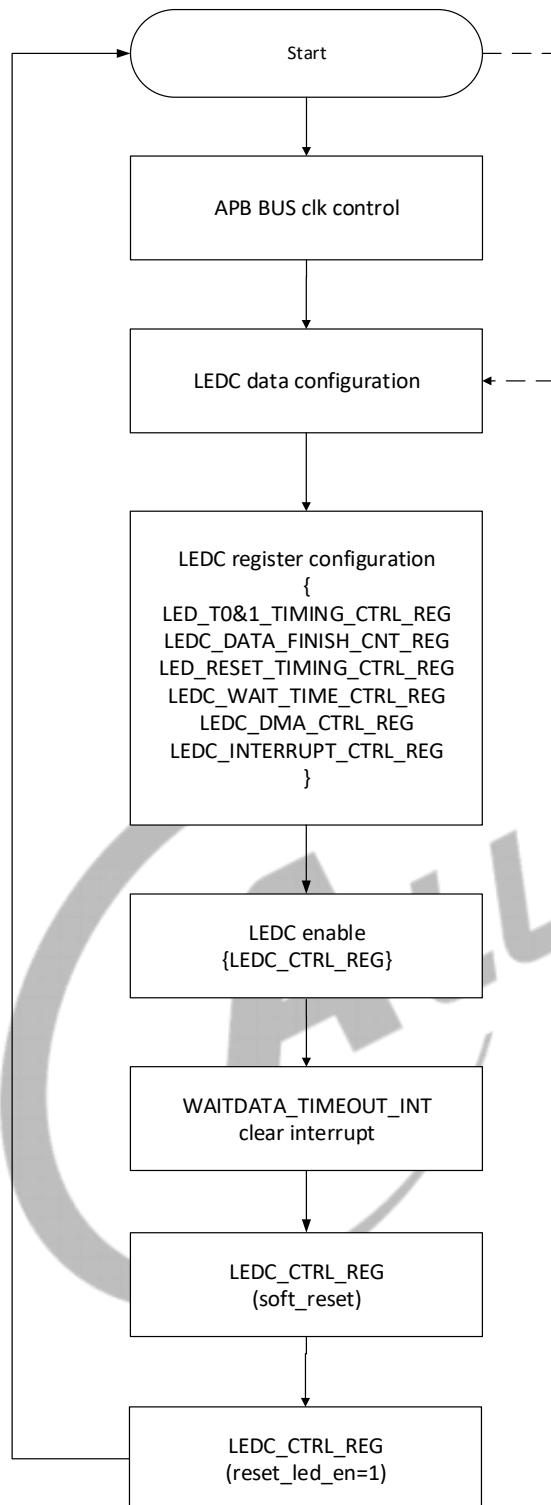

Figure 9-100 LEDC Normal Configuration Process

9.11.4.2 LEDC Abnormal Scene Processing Flow

WAITDATA_TIMEOUT Abnormal Status

- Step 1** When WAITDATA_TIMEOUT_INT appears, it indicates the internal FIFO data request of LEDC cannot obtain a response, at this time if the default output level is low, then the external LED may think there was a reset operation and cause LED data to be flushed incorrectly.
- Step 2** The LEDC needs to be performed soft_reset operation (LED_C_SOFT_RESET=1); after soft_reset, the LEDC_EN will be pulled-down automatically, all internal status register and control state machine will return to the idle state, the LEDC FIFO read & write point is cleared to 0, the LEDC interrupt is cleared.
- Step 3** Setting reset_led_en to 1 indicates LEDC can actively send a reset operation to ensure the external LED lamp in the right state.
- Step 4** The software reads the status of reset_led_en, when the status value is 1, it indicates LEDC does not perform the transmission of LED reset operation; when the status value is 0, the LEDC completes the transmission of LED reset operation.
- Step 5** When LEDC reset operation finishes, the LEDC data and register configuration need to be re-operated to start re-transmission data operation.

Figure 9-101 LEDC Timeout Abnormal Processing Flow

FIFO Overflow Abnormal Status

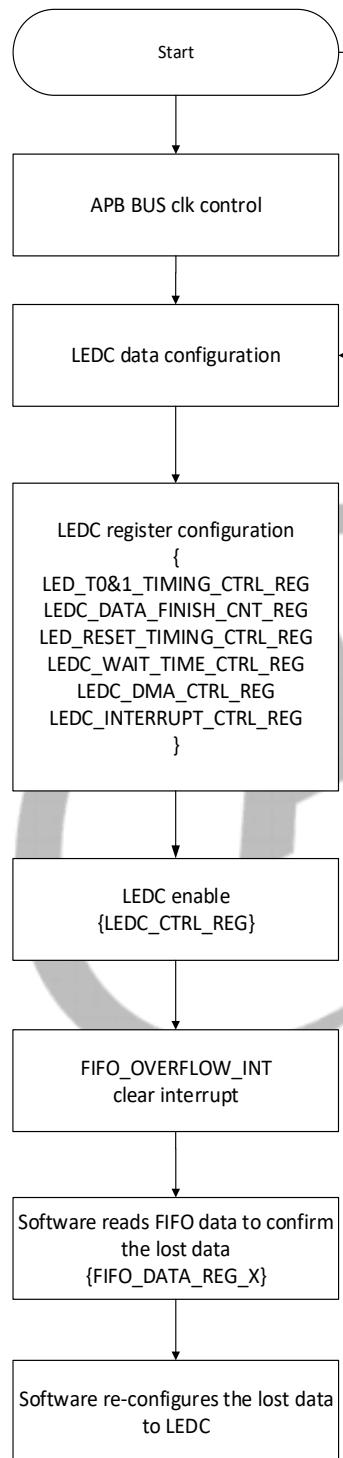

Step 1 When FIFO_OVERFLOW_INT appears, it indicates the data configured by software exceeds the LEDC FIFO space, at this time the redundant data will be lost.

Step 2 The software needs to read data in [LEDC_FIFO_DATA_X](#) to confirm the lost data.

Step 3 The software re-configures the lost data to the LEDC.

Step 4 If the software uses the soft_reset operation, the operation is the same with the timeout abnormal processing flow.

9.12 EMAC

9.12.1 Overview

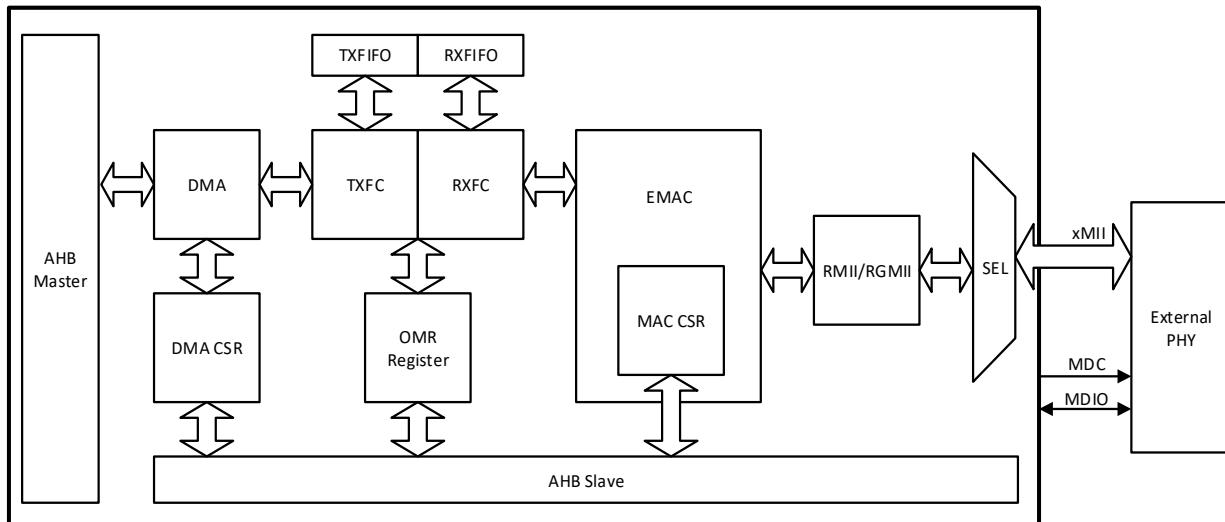

The Ethernet Medium Access Controller (EMAC) enables a host to transmit and receive data over Ethernet in compliance with the IEEE 802.3-2002 standard. It supports 10/100/1000 Mbit/s external PHY with RMII/RGMII interface in full-duplex and half-duplex modes. The internal DMA is designed for packet-oriented data transfers based on a linked list of descriptors.

The EMAC has the following features:

- One 10/100/1000 Mbit/s Ethernet port with reduced gigabit media independent interface (RGMII) and reduced media independent interface (RMII) interfaces, for connecting the external EPHY
- Compliant with IEEE 802.3-2002 standard
- Provides the management data input/output (MDIO) interface for PHY device configuration and management with configurable clock frequencies
- Supports both full-duplex and half-duplex operations
- Programmable frame length to support Standard or Jumbo Ethernet frames with sizes up to 16 KB
- Supports a variety of flexible address filtering modes
- Separate 32-bit status returned for transmission and reception packets
- Optimization for packet-oriented DMA transfers with frame delimiters
 - Supports linked-list descriptor list structure
 - Descriptor architecture, allowing large blocks of data transfer with minimum CPU intervention; each descriptor can transfer up to 4 KB of data
 - Comprehensive status reporting for normal operation and transfers with errors
- 4 KB TXFIFO for transmission packets and 16 KB RXFIFO for reception packets
- Programmable interrupt options for different operational conditions

9.12.3.4 EMAC RX/TX Descriptor

The internal DMA of EMAC transfers data between host memory and internal RX/TX FIFO by a linked list of descriptors. Each descriptor consists of four words and contains some necessary information to transfer TX and RX frames. The following figure shows the descriptor list structure. The address of each descriptor must be 32-bit aligned.

Figure 9-105 EMAC RX/TX Descriptor List

9.12.3.5 TX Descriptor

1st Word of TX Descriptor

Bits	Description
31	TX_DESC_CTL When set, the current descriptor can be used by DMA. This bit is cleared by DMA when the whole frame is transmitted or all data in the buffer of the current descriptor are transmitted.
30:17	Reserved
16	TX_HEADER_ERR When set, the checksum of the header for the transmitted frame is wrong.
15	Reserved
14	TX_LENGTH_ERR When set, the length of the transmitted frame is wrong.
13	Reserved
12	TX_PAYLOAD_ERR When set, the checksum of the payload for the transmitted frame is wrong.
11	Reserved
10	TX_CRS_ERR When set, the carrier is lost during transmission.
9	TX_COL_ERR_0 When set, the frame is aborted because of a collision after the contention period.
8	TX_COL_ERR_1 When set, the frame is aborted because of too many collisions.
7	Reserved

Bits	Description
6:3	TX_COL_CNT The number of collisions before transmission.
2	TX_DEFER_ERR When set, the frame is aborted because of too much deferral.
1	TX_UNDERFLOW_ERR When set, the frame is aborted because of the TX FIFO underflow error.
0	TX_DEFER When set in Half-Duplex mode, the EMAC defers the frame transmission.

2nd Word of TX Descriptor

Bits	Description
31	TX_INT_CTL When it is set and the current frame has been transmitted, the TX_INT in Interrupt Status Register will be set.
30	LAST_DESC When it is set, the current descriptor is the last one of the current frame.
29	FIR_DESC When it is set, the current descriptor is the first one of the current frame.
28:27	CHECKSUM_CTL These bits control to insert checksum in the transmit frame.
26	CRC_CTL When it is set, the CRC field is not transmitted.
25:11	Reserved
10:0	BUF_SIZE The size of the buffer specified by the current descriptor.

3rd Word of TX Descriptor

Bits	Description
31:0	BUF_ADDR The address of the buffer specified by the current descriptor.

4th Word of TX Descriptor

Bits	Description
31:0	NEXT_DESC_ADDR The address of the next descriptor. It must be 32-bit aligned.

9.12.3.6 RX Descriptor**1st Word of RX Descriptor**

Bits	Description
31	RX_DESC_CTL When it is set, the current descriptor can be used by DMA. This bit is cleared by DMA when the complete frame is received or the buffer of the current descriptor is full.
30	RX_DAF_FAIL When it is set, the current frame does not pass the DA filter.
29:16	RX_FRM_LEN When LAST_DESC is not set and no error bit is set, this field is the length of received data for the current frame. When LAST_DESC is set, RX_OVERFLOW_ERR and RX_NO_ENOUGH_BUF_ERR are not set, this field is the length of the received frame.
15	Reserved
14	RX_NO_ENOUGH_BUF_ERR When it is set, the current frame is clipped because of no enough buffer.
13	RX_SAF_FAIL When it is set, the current frame does not pass the SA filter.
12	Reserved
11	RX_OVERFLOW_ERR When it is set, a buffer overflow error occurred and the current frame is wrong.
10	Reserved
9	FIR_DESC When it is set, the current descriptor is the first descriptor of the current frame.
8	LAST_DESC When it is set, the current descriptor is the last descriptor of the current frame.
7	RX_HEADER_ERR When it is set, the checksum of the frame header is wrong.

Bits	Description
6	RX_COL_ERR When it is set, there is a late collision during the reception in half-duplex mode.
5	Reserved
4	RX_LENGTH_ERR When it is set, the length of the current frame is wrong.
3	RX_PHY_ERR When it is set, the receive error signal from PHY is asserted during the reception.
2	Reserved
1	RX_CRC_ERR When it is set, the CRC field of the received frame is wrong.
0	RX_PAYLOAD_ERR When it is set, the checksum or length of the payload for the received frame is wrong.

2nd Word of RX Descriptor

Bits	Description
31	RX_INT_CTL When it is set and a frame has been received, the RX_INT will not be set.
30:11	Reserved
10:0	BUF_SIZE The size of the buffer is specified by the current descriptor.

3rd Word of RX Descriptor

Bits	Description
31:0	BUF_ADDR The address of the buffer specified by the current descriptor.

4th Word of RX Descriptor

Bits	Description
31:0	NEXT_DESC_ADDR The address of the next descriptor. This field must be 32-bit aligned.

9.12.4 Programming Guidelines

9.12.4.1 EMAC System Configuration

Perform the following steps:

- Step 1** Write 0 to [EMAC_BGR_REG](#)[bit16] to assert the module reset.
- Step 2** Write 1 to [EMAC_BGR_REG](#)[bit16] to deassert the module reset.
- Step 3** Write 1 to [EMAC_BGR_REG](#)[bit0] to enable the bus clock of the module.
- Step 4** Configure the pin interfaces of EMAC by setting GPIO module.
- Step 5** Configure [EMAC_EPHY_CLK_REG0](#) to set the transmission clock source of RGMII/RMII.

For RGMII RXCLK/CLK125M:

In RGMII mode, in addition to the configuration of the transmission clock source, it is generally necessary to adjust the timing by configuring the transmission clock delay, reception clock delay, transmission clock reverse, reception clock reverse.

- Write 0 to the bit[13] and write 1 to the bit[2] to select the RGMII interface.
- If selecting RXCLK as the clock source of RGMII, write 2 to the bit[1:0]; if selecting CLK125M as the clock source of RGMII, write 1 to the bit[1:0].
- Write 0 to the bit[3], write 0 to the bit[4], write 31 to the bit[9:5], and write 7 to the bit[12:10] to transmit the reception sequence adjustment.

For RMII TXCLK:

- Write 1 to the bit[13] and write 0 to the bit[2] to select the RMII interface.
- Write 0 to the bit[0] to select TXCLK as the clock source of RMII.

The configuration value of [EMAC_EPHY_CLK_REG0](#) can refer to the following table.

Table 9-39 EMAC_EPHY_CLK_REG0 Configuration Value

EMAC_EPHY_CLK_REG0	PHY_SEL	RMII_EN	ETXDC	ERXDC	ERXIE	ETXIE	RMII/RGMII	ETCS
	Bit15	Bit13	Bit[12:10]	Bit[9:5]	Bit4	Bit3	Bit2	Bit[1:0]
RGMII	0	0	7	31	0	0	1	1/2
RMII	0	1	0	0	0	0	0	0

9.12.4.2 EMAC Initialization

- Step 1** Write 1 to [EMAC_BASIC_CTL1](#)[bit0] to perform the software reset.

- Step 2** Write 1 to EMAC_BASIC_CTL1[bit1] to set the DMA priority of TX/RX.
- Step 3** Configure EMAC_TX_CTL1 and EMAC_RX_CTL1 to set the configuration of DMA TX and DMA RX.
- Step 4** Configure EMAC_INT_EN to set the corresponding interrupts and shield the needless interrupts.
- Step 5** Configure EMAC_TX_DMA_LIST and EMAC_RX_DMA_LIST to set the first address of the TX descriptor and the RX descriptor, respectively.
- Step 6** Configure EMAC_TX_CTL0 and EMAC_RX_CTL0 to set the TX and RX parameters. Configure EMAC_BASIC_CTL0 to set the speed, duplex mode, loopback configuration. (If enabled the auto-negotiation, the configuration is performed as a result of the negotiation)
- Step 7** Configure EMAC_RX_FRM_FLT to set the RX frame filter.
- Step 8** Configure EMAC_TX_FLOW_CTL and EMAC_RX_CTL0 to set the control mechanism of TX and RX.
- Step 9** Clear all interrupt flags.
- Step 10** Write 1 to EMAC_TX_CTL0[bit31] and write 1 to EMAC_RX_CTL0[bit31] to enable the TX and RX functions.

9.13 CIR Receiver

9.13.1 Overview

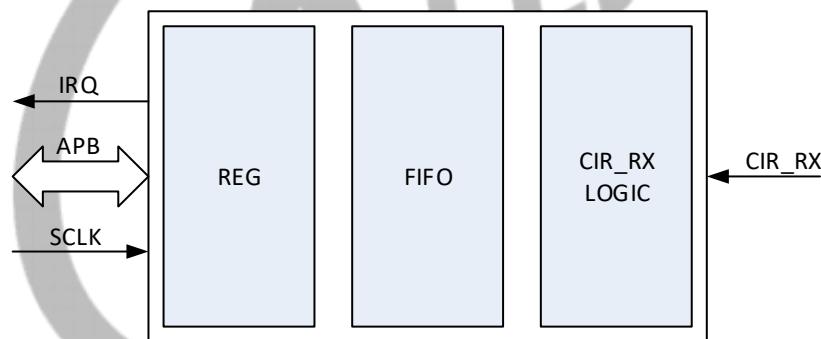

The Consumer Infrared receiver (CIR_RX) captures pulse from the IR Receiver module and uses the Run-Length Code (RLC) to encode the pulse.

The CIR receiver has the following features:

- Supports CIR remote control receiver
- Supports NEC IR protocol
- 64x8 bits RX FIFO for data buffer
- Programmable RX FIFO thresholds
- Supports interrupt
- Sample clock up to 1 MHz

9.13.2 Block Diagram

Figure 9-106 CIR_RX Block Diagram

The CIR_RX samples the input signal on the programmable frequency and records these samples into RX FIFO when one CIR signal is found on the air. The CIR_RX uses Run-Length Code (RLC) to encode pulse width. The encoded data is buffered in 64 levels and 8-bit width RX FIFO; the MSB bit is used to record the polarity of the receiving CIR signal, the rest 7 bits are used for the length of RLC. The maximum length of the RLC is 128. If the duration of one level (high or low level) is more than 128, another byte is used.

9.13.3 Functional Description

9.13.3.1 External Signals

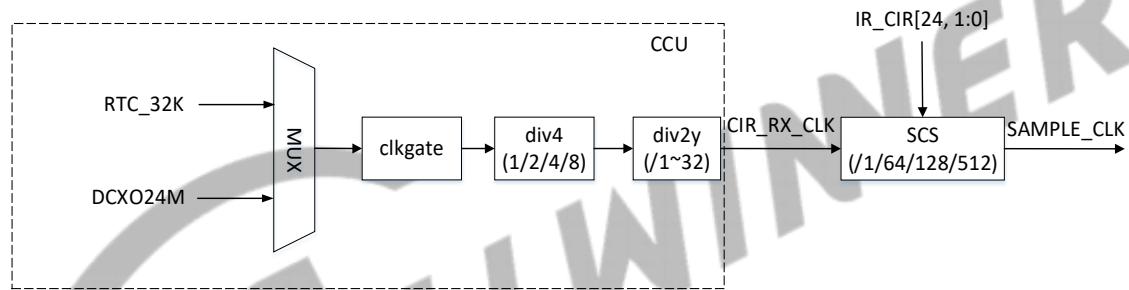

The following table describes the external signals of CIR_RX.

Table 9-40 CIR_RX External Signals

Signal	Description	Type
IR-RX	Consumer Infrared Receiver	I

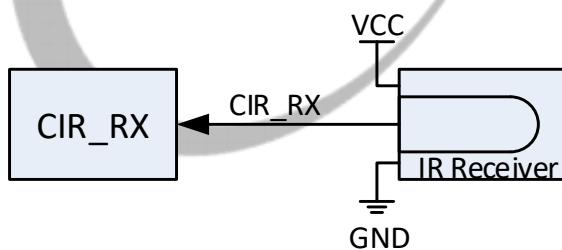

9.13.3.2 Clock Sources

Figure 9-107 CIR_RX Clock System

9.13.3.3 Typical Application

Figure 9-108 CIR_RX Application Diagram

9.13.3.4 NEC Protocol Format

Figure 9-109 NEC Protocol

The CIR_RX module is a timer with a capture function.

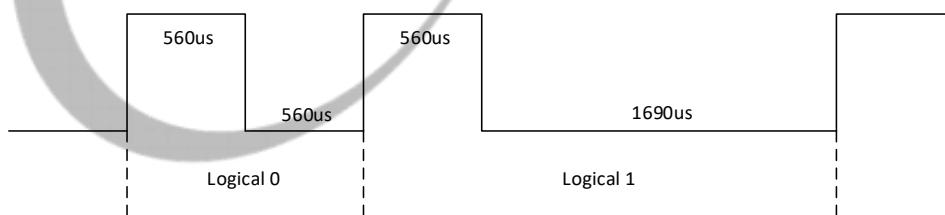

When CIR_RX signals satisfy the Active Threshold (ATHR), the CIR receiver can start to capture. In the process, the signal is ignored if the pulse width of the signal is less than NTHR. When CIR_RX signals satisfy ITHR (Idle Threshold), the capture process is stopped and the Receiver Packet End interrupt is generated, then the Receiver Packet End Flag is asserted.

In a capture process, every effective pulse is buffered to FIFO in bytes according to the form of the Run-Length Code. The MSB bit of a byte is the polarity of pulse, and the rest 7 bits is pulse width by taking Sample Clock as a basic unit. This is the code form of the RLC-Byte. When the level changes or the pulse width counter overflows, the RLC-Byte is buffered to FIFO. The CIR_RX module receives the infrared signals transmitted by the infrared remote control, the software decodes the signals.

9.13.3.5 Operating Mode

Sample Clock

Figure 9-110 Logical '0' and Logical '1' of NEC Protocol

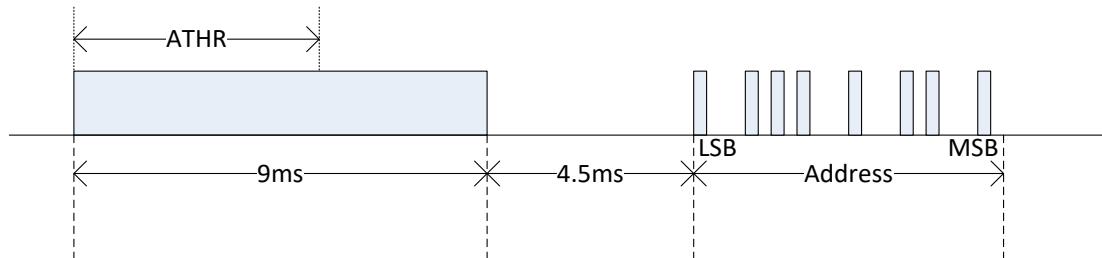

For NEC protocol, a logical "1" takes 2.25 ms (560 us+1680 us) to transmit, while a logical "0" is only half of that, being 1.12 ms (560 us+560 us).

For example, if the sample clock is 31.25 kHz, a sample cycle is 32 us, then 18 sample cycles are 560 us. So the RLC of 560 us low level is 0x12 (b'00010010), the RLC of 560 us high level is 0x92 (b'10010010). Then a logical "1" takes code 0x12 (b'00010010) and code 0xb5 (b'10110101) to transmit, a logical "0" takes code 0x12 and code 0x92 to transmit.

Active Threshold (ATHR)

When the CIR_RX is in Idle state, if the electrical level of the CIR_RX signal changes (positive jump or negative jump), and the duration reaches this threshold, then the CIR_RX takes the starting of the signal as a lead code, and the CIR_RX turns into an active state and starts to capture CIR_RX signals.

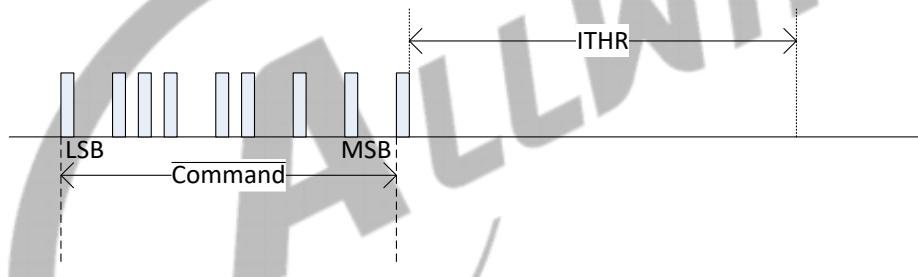

Figure 9-111 ATHR Definition

Idle Threshold (ITHR)

If the electrical level of CIR_RX signals has no change, and the duration reaches this threshold, then the CIR_RX enters into Idle state and ends this capture.

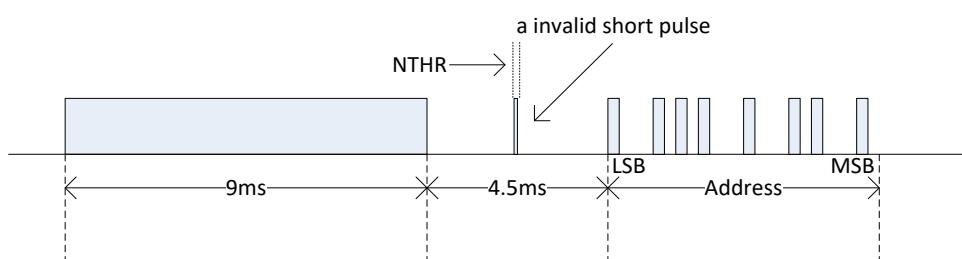

Figure 9-112 ITHR Definition

Noise Threshold (NTHR)

In the capture process, the pulse is ignored if the pulse width is less than the Noise Threshold.

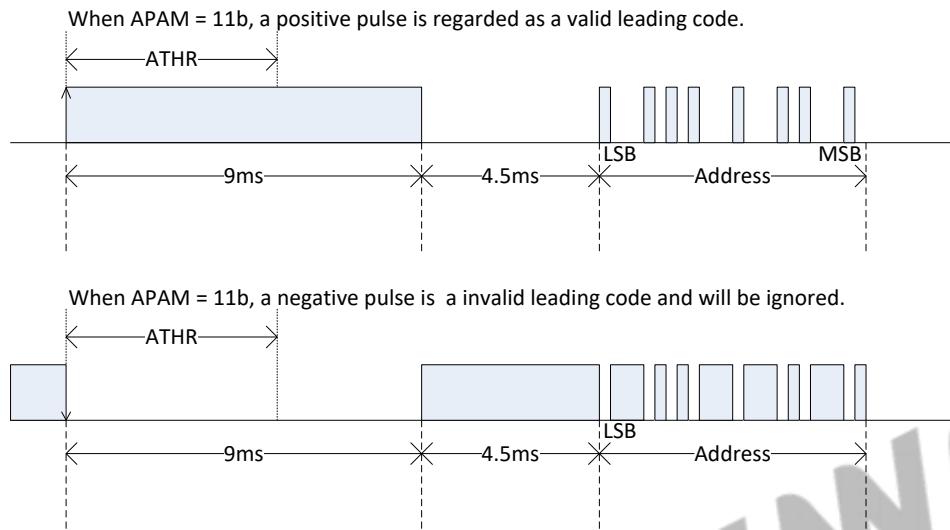

Figure 9-113 NTHR Definition

Active Pulse Accept Mode (APAM)

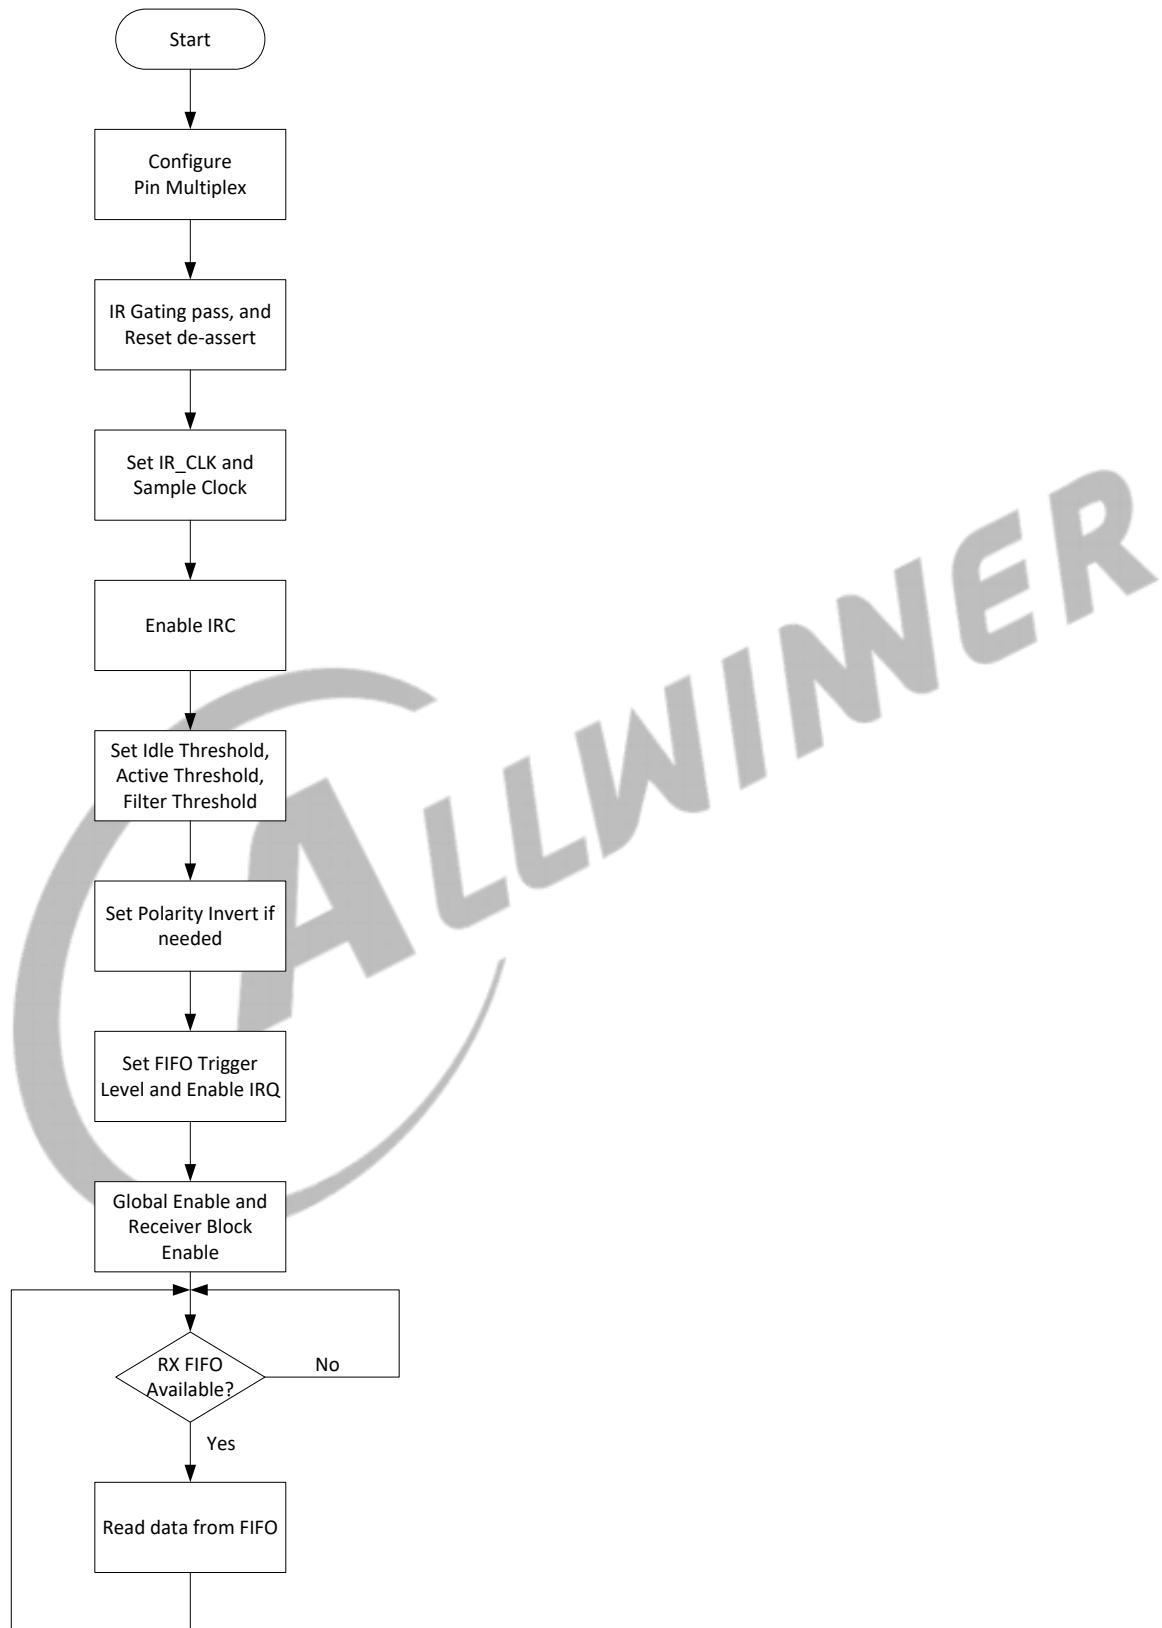

The APAM is used to fit the type of lead code. If a pulse does not fit the type of lead code, it is not regarded as a lead code even if the pulse width reaches ATHR.

22:16	R/W	0x0	ATHR Active Threshold for CIR These bits control the duration of CIR from the idle to the active state. The duration can be calculated by ((ATHR + 1)*(ATHC? Sample Clock: 128*Sample Clock)).
15:8	R/W	0x18	ITHR Idle Threshold for CIR The Receiver uses it to decide whether the CIR command is received. If there is no CIR signal on the air, the receiver is staying in IDLE status. One active pulse will bring the receiver from IDLE status to Receiving status. After the CIR receiver ends, the inputting signal will keep the specified level (high or low level) for a long time. The receiver can use this idle signal duration to decide that it has received the CIR command. The corresponding flag is asserted. If the corresponding interrupt is enabled, the interrupt line is asserted to the CPU. When the duration of the signal keeps one status (high or low level) for the specified duration ((ITHR + 1)*128 sample_clk), this means that the previous CIR command is finished.

9.14 CIR Transmitter

9.14.1 Overview

The CIR transmitter (CIR_TX) can transfer arbitrary waves which can be modulated with configurable carrier waves such as 38 kHz.

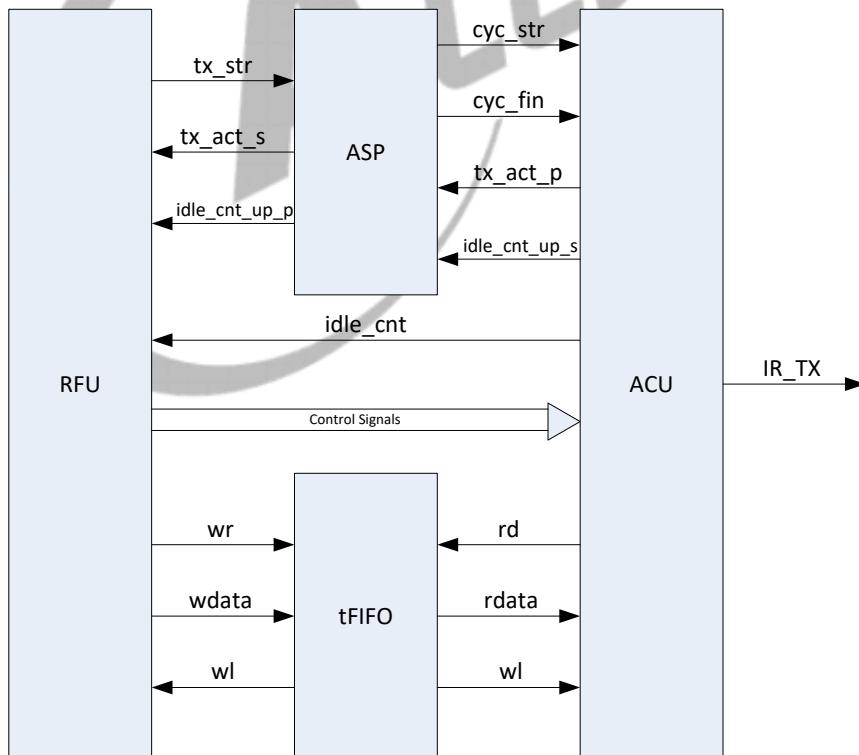

The CIR_TX has the following features:

- Supports CIR remote control transmitter
- 128 bytes FIFO for data buffer
- Configurable carrier frequency
- Supports Interrupt and DMA
- Supports handshake mode and waiting mode of DMA

9.14.2 Block Diagram

The following figure shows a block diagram of the CIR_TX.

9.14.3.1 External Signals

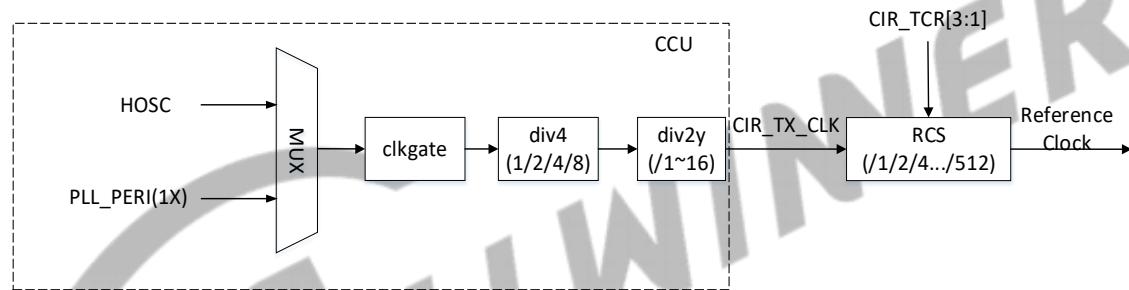

The following table describes the external signals of CIR_TX.

9.14.3.2 Clock Sources

Figure 9-117 CIR_TX Clock System

9.14.3.3 Function Implementation

The CIR_TX is used to generate a waveform of arbitrary length, arbitrary shape, and no high-speed requirement, and it can change the data into the high-/low-level sequence of a certain length. Every transmitting data is in bytes, the Bit[7] of a byte means whether the level of a transmitting wave is high or low, the Bit[6:0] is the length of this wave. If the current transmitting frequency-division is 1, 0x88 is a high level of 8 cycles, 0x08 is a low level of 8 cycles. If the current transmitting frequency-division is 4, 0x88 is a high level of 32 cycles, 0x08 is a low level of 32 cycles.

The CIR_TX has two transmission modes: non-cycle transmission, and cycle transmission.

The non-cycle transmission is to transmit all the data in TX_FIFO until the FIFO is empty.

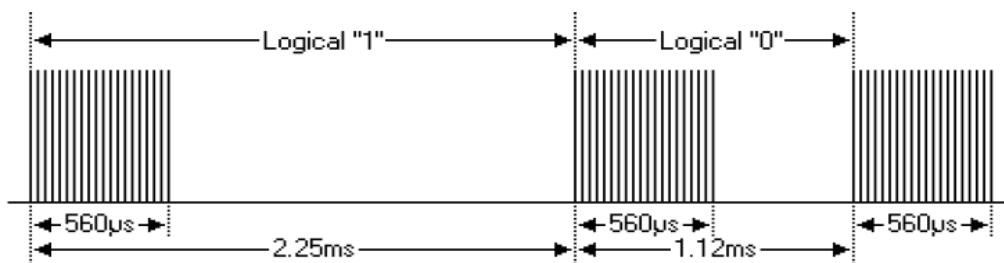

The cycle transmission is to transmit all the data in TX_FIFO, after the transmission completion, wait for a certain time to recover the data in TX_FIFO and then send it until a stop signal is detected. The data recovery in FIFO is implemented by clearing the read pointer.

9.14.3.4 Timing Diagram

The CIR remote control contains many protocols designed by different manufacturers. Here to NEC protocol as an example, the CIR-TX module uses a variable pulse-width modulation technique to encompass the various formats of infrared encoding for remote-control applications. A message is started by a 9 ms AGC burst, which is used to set the gain of the earlier CIR receivers. This AGC burst is then followed by a 4.5 ms space, which is then followed by the address and command.

Bit definition: the logical “1” takes 2.25 ms to transmit, while a logical “0” is only 1.12 ms.

10.1 Crypto Engine

10.1.1 Overview

The Crypto Engine (CE) module is one encryption/decryption algorithm accelerator. It supports kinds of symmetric, asymmetric, Hash, and RNG algorithms.

The symmetric algorithm supports data encryption and decryption by following the data encryption standard (DES), 3DES, or advanced encryption standard (AES) algorithms. It can encrypt or decrypt a large amount of data effectively.

The Rivest-Shamir-Adleman (RSA) asymmetric algorithm is used for data encryption/decryption and digital signature verification. It is a public key encryption/decryption algorithm implemented through the modular exponentiation operation.

The Hash algorithm supports data integrity authentication and digital signature. The hash supports MD5, SHA1, SHA224, SHA256, SHA384, SHA512, HMAC-SHA1, and HMAC-SHA256 algorithms.

The RNG algorithm can generate true-random numbers and pseudo-random numbers.

The T113-S3 has two separate CE controllers: one CE is for secure world, the other CE is for non-secure world. The software interface of the CE is simple, only setting interrupt control, task description address, and load tag. The algorithm control information is written in memory by task descriptor, then the CE automatically reads it when executing a request. It supports parallel execution of 4 channels and has an internal DMA controller to transfer data between CE and memory.

The CE has the following features:

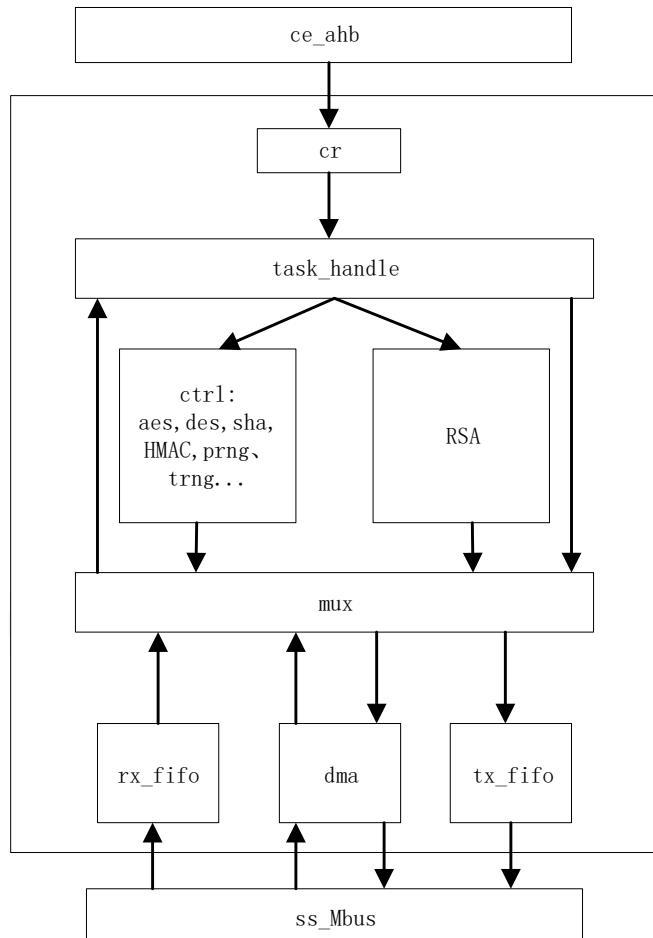

- Symmetrical algorithm: AES, DES, 3DES
- Hash algorithm: MD5, SHA1, SHA224, SHA256, SHA384, SHA512, HMAC-SHA1, HMAC-SHA256
- Asymmetrical algorithm: RSA512/1024/2048-bit
- 160-bit hardware PRNG with 175-bit seed
- 256-bit hardware TRNG
- Electronic codebook (ECB), cipher block chaining (CBC), counter (CTR), cipher text stealing (CTS), 128-output feedback (OFB), 1-/8-/64-/128-cipher feedback (CFB) modes for AES algorithm
- ECB, CBC, CTR modes for DES/3DES algorithm
- 128-, 192-, 256-bit key size for AES algorithms
- 16-, 32-, 64-, 128-bit wide size for AES CTR mode

- 16-, 32-, 64-bit wide size for DES/3DES CTR mode
- One or more blocks mode for MD5/SHA1/SHA224/SHA256/SHA384/SHA512
- Internal DMA controller for data transfer with memory
- Supports secure and non-secure interfaces respectively

10.1.2 Block Diagram

The following figure shows the block diagram of Crypto Engine.

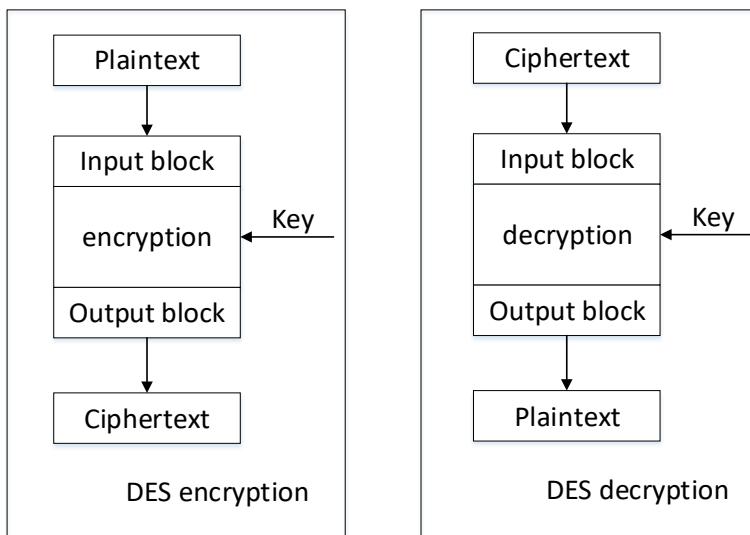

Figure 10-1 CE Block Diagram

10.1.3 Functional Description

10.1.3.1 DES Algorithm

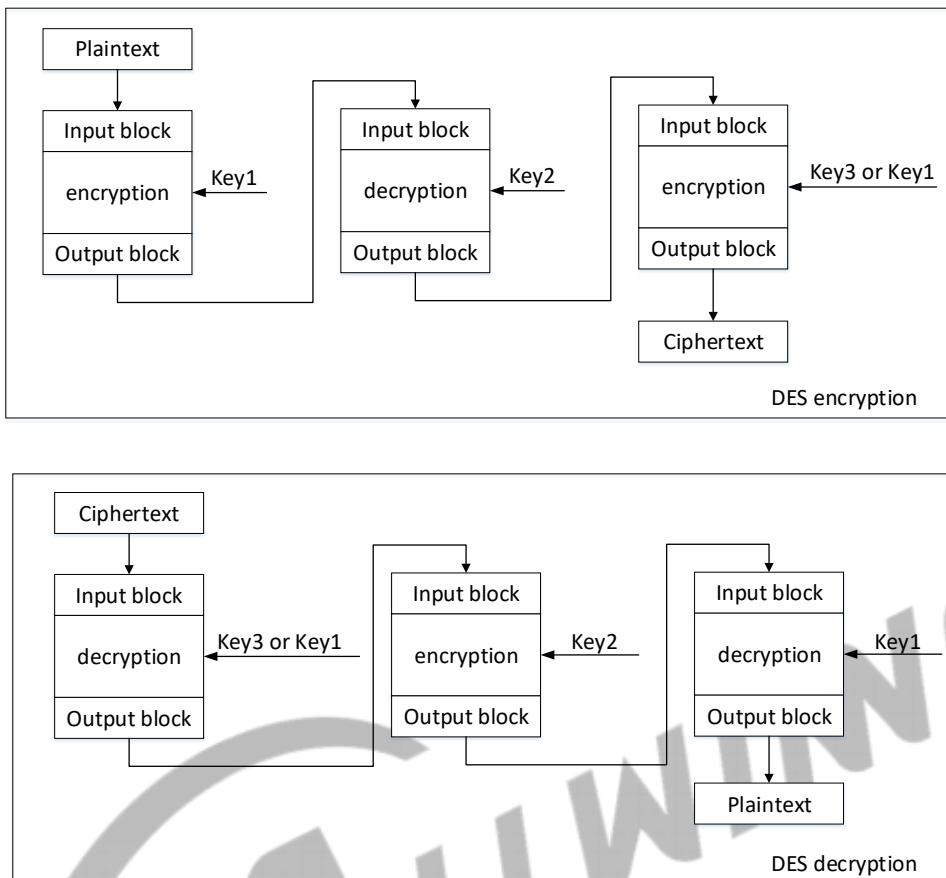

Figure 10-2 shows the DES encryption and decryption operation.

Figure 10-2 DES Encryption and Decryption

10.1.3.2 3DES Algorithm

The 3DES algorithm supports both 3-key and 2-key operations. A 2-key operation can be regarded as a simplified 3-key operation. To be specific, key 3 is represented by key 1 in a 2-key operation. Figure 10-3 shows the 3DES encryption and decryption operation of a 3-key operation and a 2-key operation.

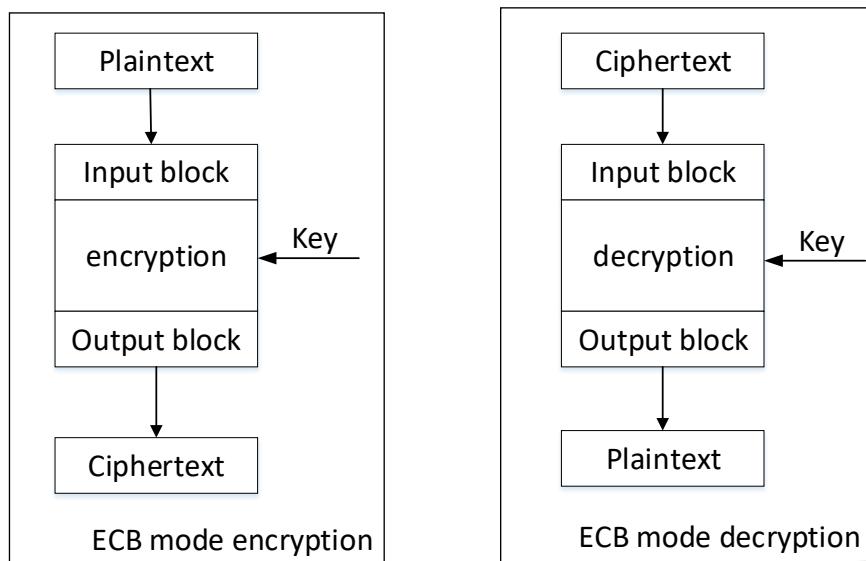

Figure 10-3 3DES Encryption and Decryption of a 3-key Operation and a 2-key Operation

10.1.3.3 ECB Mode

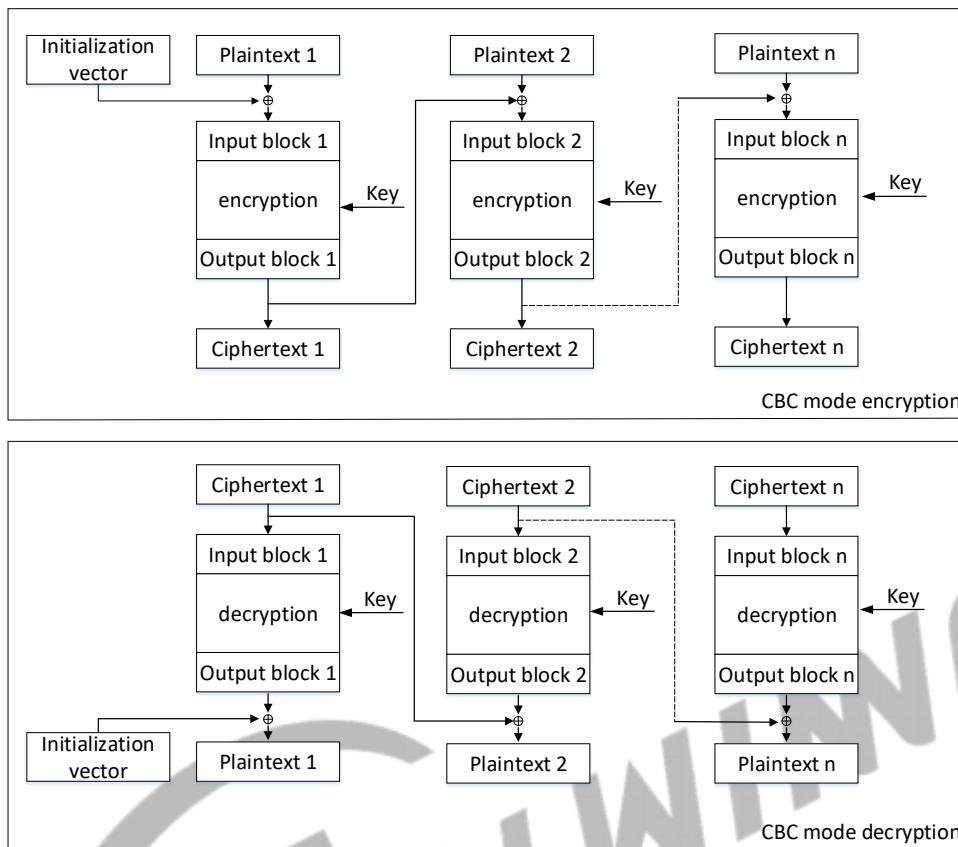

The ECB mode is a confidentiality mode that features, for a given key, the assignment of a fixed ciphertext block to each plaintext block, analogous to the assignment of code words in a codebook.

In ECB mode, encryption and decryption algorithms are directly applied to the block data. The operation of each block is independent, so the plaintext encryption and ciphertext decryption can be performed concurrently.

Figure 10-4 ECB Mode Encryption and Decryption

10.1.3.4 CBC Mode

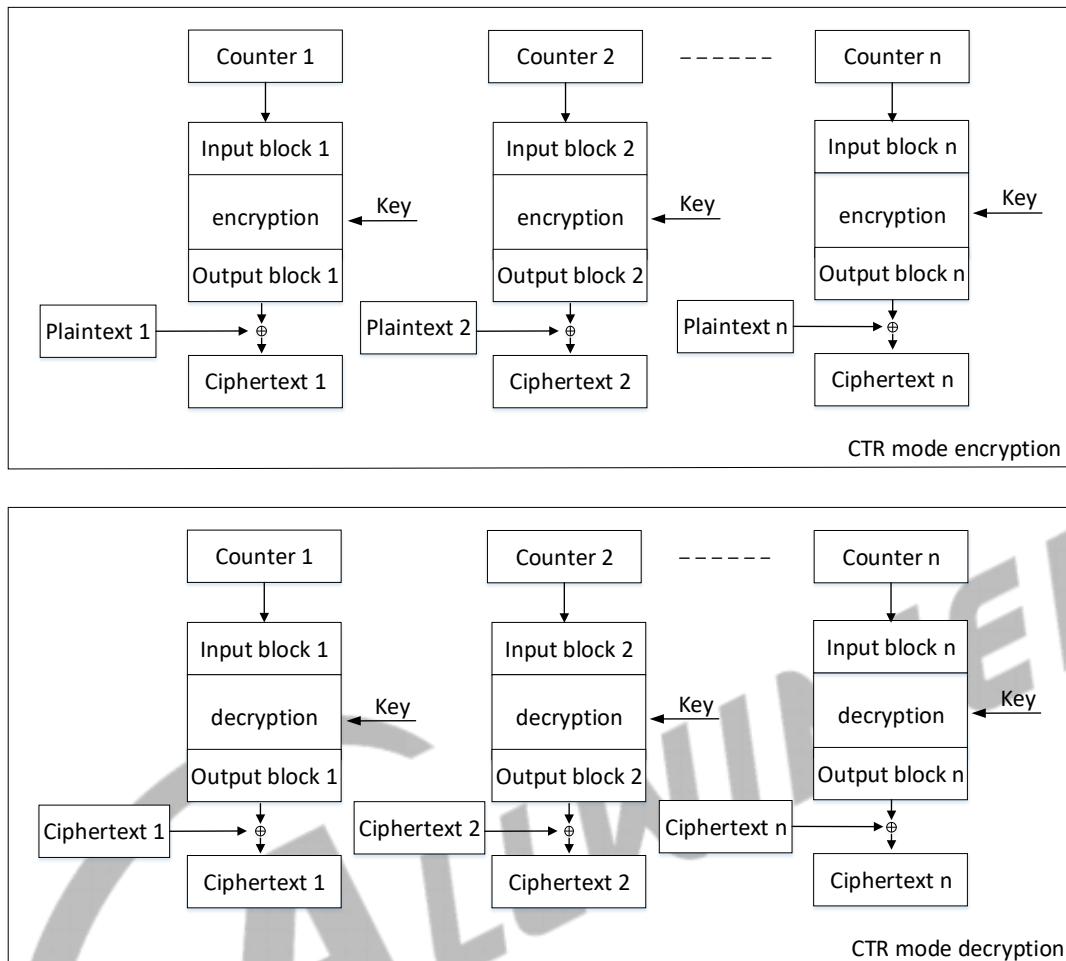

The CBC mode is a confidentiality mode whose encryption process features the combining of the plaintext blocks with the previous ciphertext blocks. The CBC mode requires an initialization vector (IV) to combine with the first plaintext block. The encryption process of each plaintext block is related to the block processing result of the previous ciphertext blocks, so encryption operations cannot be concurrently performed in CBC mode. The decryption operation is independent of output plain text of the previous block, so decryption operations can be performed concurrently.

Figure 10-5 CBC Mode Encryption and Decryption

10.1.3.5 CTR Mode

The CTR mode is a confidentiality mode that features the application of the forward cipher to a set of input blocks, called counters, to produce a sequence of output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. All of the counters must be distinct.

Figure 10-6 CTR Mode Encryption and Decryption

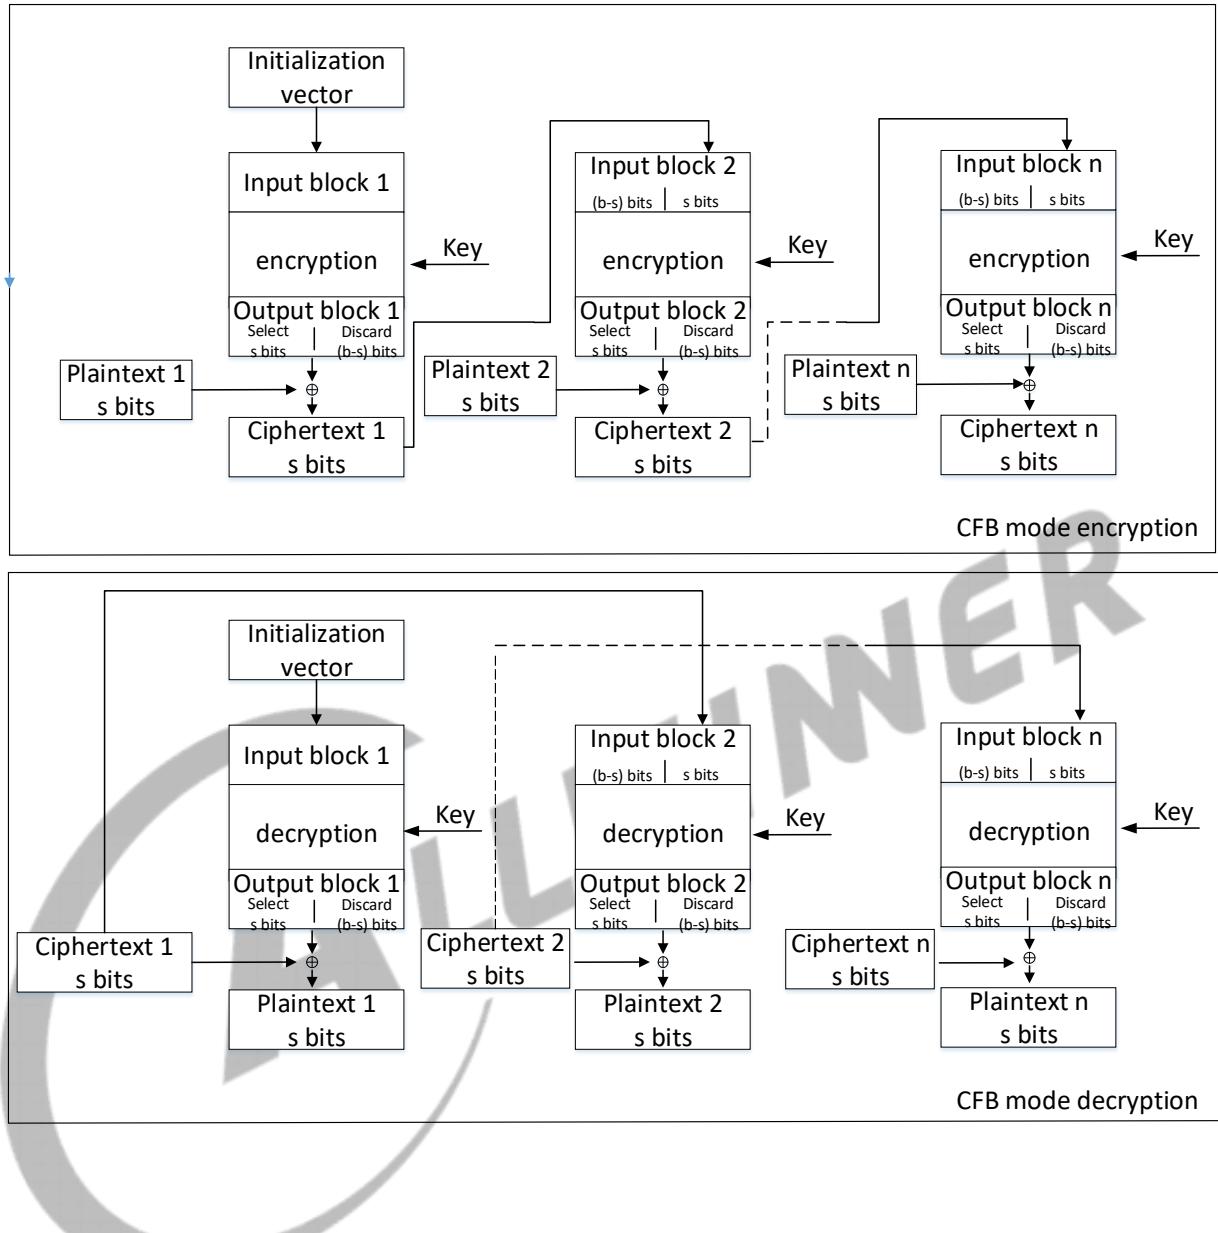

10.1.3.6 CFB Mode

The CFB mode is a confidentiality mode that features the feedback of successive ciphertext segments into the input blocks of the forward cipher to generate output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. The CFB mode requires an IV as the initial input block, and the forward cipher operation is applied to the IV to produce the first output block. The first ciphertext segment is produced by exclusive-ORing the first plaintext segment with the s most significant bits of the first output block. The value of s is 1 bit, 8 bits, 64 bits, or 128 bits.

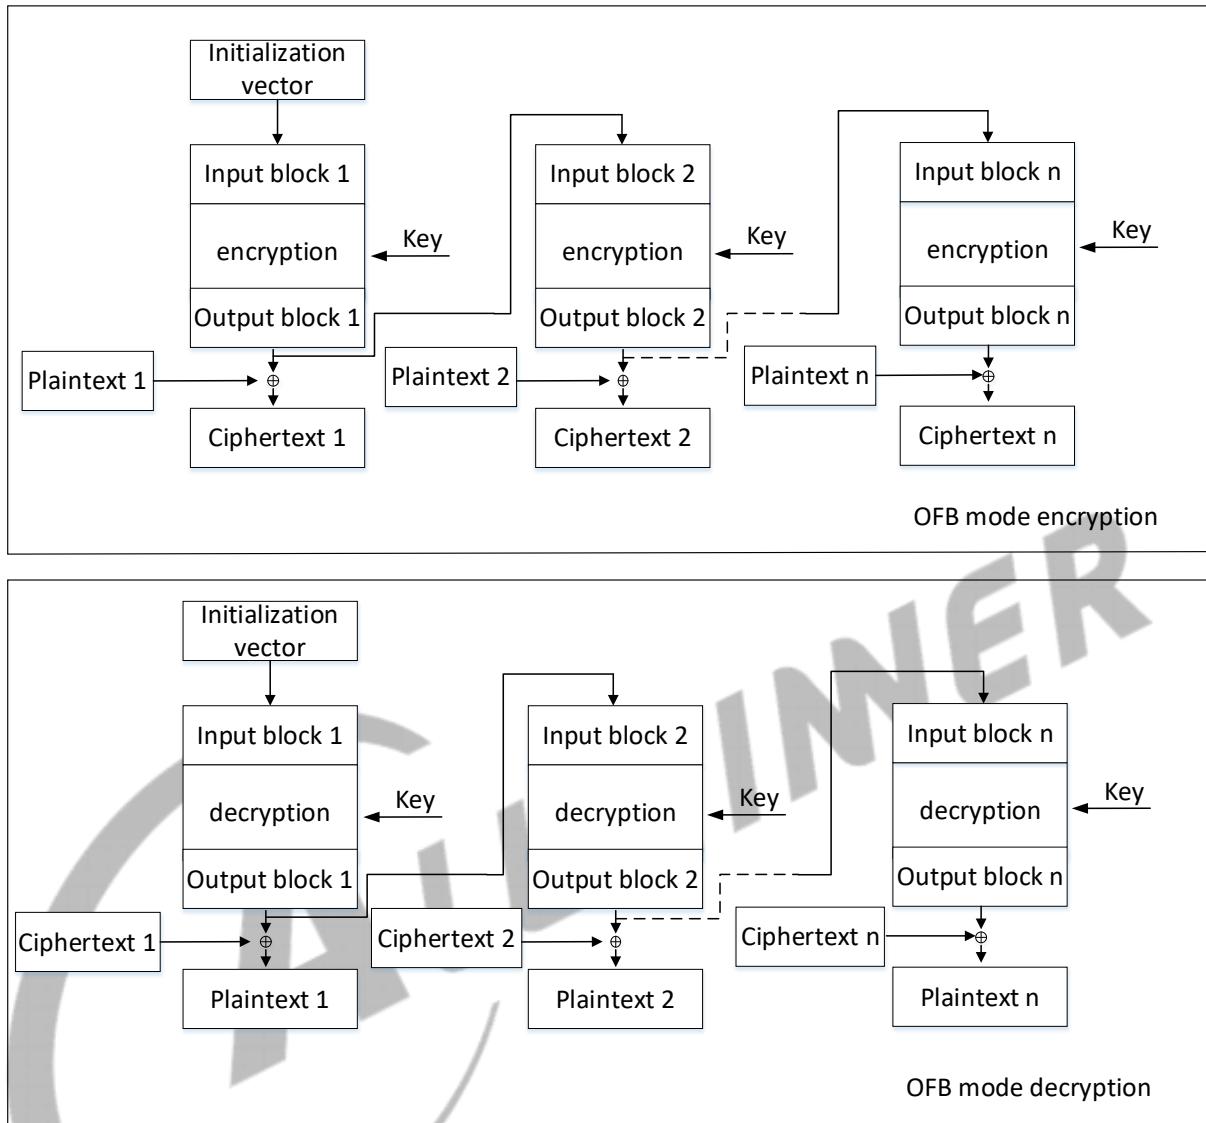

The following figure shows the s -bit CFB mode of the AES algorithms.

Figure 10-7 CFB Mode Encryption and Decryption

10.1.3.7 OFB Mode

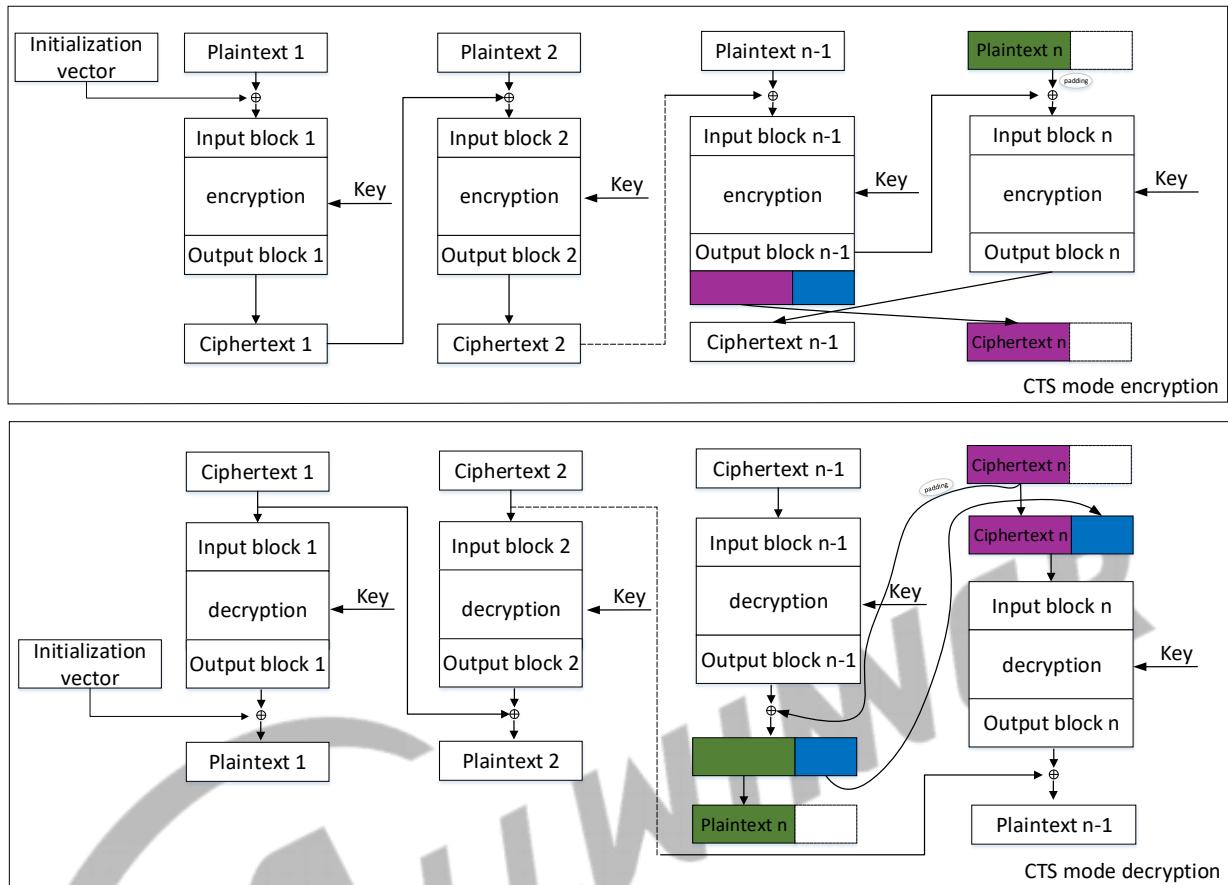

The OFB mode is a confidentiality mode that features the iteration of the forward cipher on an IV to generate a sequence of output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. If a same key is used, different IVs must be used to ensure operation security.

Figure 10-8 OFB Mode Encryption and Decryption

10.1.3.8 CTS Mode

The CTS mode is a confidentiality mode that accepts any plaintext input whose bit length is greater than or equal to the block size but not necessarily a multiple of the block size. Below are the diagrams for CTS encryption and decryption.

Figure 10-9 CTS Mode Encryption and Decryption

10.1.3.9 HASH Algorithm

The hash algorithms support MD5, SHA1, SHA224, SHA256, SHA384, SHA512, HMAC-SHA1, and HMAC-SHA256. All algorithms are iterative, one-way hash functions that can process a message to produce a condensed representation called a *message digest*. When a message is received, the *message digest* can be used to verify whether the data has changed, that is, to verify its integrity.

The hash algorithm of the CE supports block-aligned total length of the input data (padded by software), that is, a multiple of 64 bytes. The message length after padding by software is used as the configured data length for the hash algorithm.

10.1.3.10 RSA Algorithm

The RSA is a public key encryption/decryption algorithm implemented through the modular exponentiation operation.

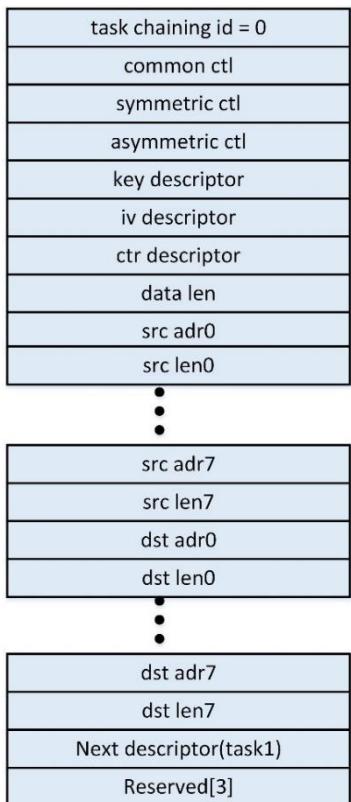

The ciphertext is obtained as follows: $C = M^E \bmod N$. The plaintext is obtained as follows: $M = C^D \bmod N$.

M indicates the plaintext, C indicates the ciphertext, (N, E) indicates the public key, and (N, D) indicates the private key.

10.1.3.11 Task Descriptor

The software makes request through task descriptor, including algorithm type, algorithm mode, key address, source/destination address and size, and so on. The structure of the task descriptor is as follows.

Figure 10-10 Structure of Task Descriptor Chaining

The bit definitions of the task descriptor are as follows.

And it is determined whether to generate an interrupt signal according to the IE configuration of the current task when the current task ends or aborts. Therefore, if you want to use interrupts, it is recommended that not only the IE of the last task of each task chain is configured to 1 to generate the end interrupt of the task chain, but also the IEs of other tasks in this task chain are also configured to 1. The purpose is to generate an interrupt signal once an abnormal error occurs in these tasks and the interrupt is aborted.</p>

31:0	R/W	0x0	IV Address The address of IV that needs to be stored.

Counter Descriptor

Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	CTR Data Output Address The address of CTR data output that needs to be stored.

Data Length

Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	Data Length Configure the data length of the corresponding segment. The data length size needs to be consistent with dst_data_length (destination data length 0 +... + destination data length 7). The data length field in the task descriptor has different meanings for different algorithms. For AES-CTS, the data length field indicates byte numbers of source data, for others indicate word numbers of source data. For PRNG, the data length should be 5 words aligned. For TRNG, it should be 8 words aligned.

31:0	R/W	0x0	Source Data Length The length of the source data. Unit: byte

Destination Address 0~7

Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	Destination Data Address The address of the destination data that needs to be stored.

Destination Data Length 0~7

Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	Destination Data Length The length of the destination data. Unit: byte

Next Descriptor Address

Bit	Read/Write	Default/Hex	Description
31:0	R/W	0x0	Next Task Address The address where the descriptor of the next task in a task-chain is saved. If there is the only task or the last task of a task-chain, the next task address must be 32'h0.

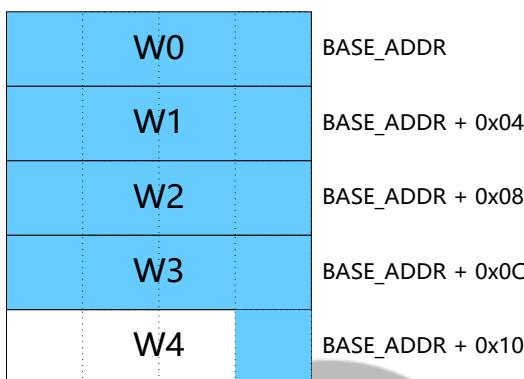

10.1.3.12 Storing Message

In the application, a message may not be stored contiguously in the memory, but divided into multiple segments. Or a piece of continuously stored messages can be artificially split into multiple pieces as needs.

Then each segment corresponds to a set of the source address and source length in the descriptor. Multiple segments correspond to groups 0-7 source address/source length in sequence.

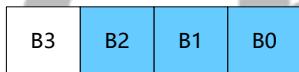

Each task supports up to 8 message segments, and the data volume of each message segment supports up to 4 GWord (AES-CTS is 1 GByte). The total amount of all segments in a task (that is a package) supports up to 4 GWord (AES-CTS is 1 GByte). If a message is divided into multiple packages, all others are required to be whole words; when the last package of AES-CTS is less than one word, 0 needs to be padded, and those less than one word are counted as one word. The following figure shows the address order structure.

Figure 10-11 Word Address of Message

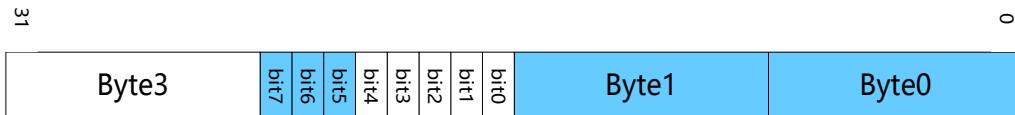

Byte order: low byte first, high byte last. When the data is less than one word, the low byte is filled first. The following figure shows the byte order structure (blue means it is filled by the message).

Figure 10-12 Byte Order

Bit order: high bit first, low bit last. When the data is less than one Byte, the high bit is filled first. The following figure shows the bit order structure.

Figure 10-13 Bit Order

10.1.3.13 Storing Key

The length of KEY must be an integer multiple of word, refer to section 10.1.3.15 “[Algorithm Length Properties](#)”.

10.1.3.14 Storing IV

For different algorithms, the length of IV is different. But they are integer multiples of word. To keep the byte order of IV and HASH digest output consistent, the byte order of IV is different from that of the message. For the multi-packet operation, the first address of the digest output result of the previous HASH can be directly configured to the first address of the next IV, and the software does not need to do any processing on the digest.

The following figure shows the storage method of 32-bit IV value.

IV0[31:0]	BASE_ADDR
IV1[31:0]	BASE_ADDR + 0x04

10.1.3.16 Security Operation

When the CPU issues request to the CE module, the CE module will save the secure mode of CPU. When executing this request, this state bit works as a access flag for the inner and system resources. For access to SID module through the AHB bus, only the secure mode can succeed, or else these keys will be read to 0 or cannot write. When issuing MBUS read and write requests, the CE will use send this secure mode bit to BUS, so secure requests can access secure and non-secure space, but non-secure requests only can access non-secure space.

10.1.3.17 Error Detection

The CE module includes error detection for task configuration, data computing error, and authentication invalid. When the algorithm type in task descriptor is read into the CE module, the CE will check whether this type is supported through checking algorithm type field in common control. If the type value is out of scope, the CE will issue interrupt signal and set error state. Each type has certain input and output data size. After getting a task descriptor, the input size and output size configuration will be checked to avoid size error. If the size configuration is wrong, the CE will issue interrupt signal and set error state.

10.1.3.18 Clock Requirement

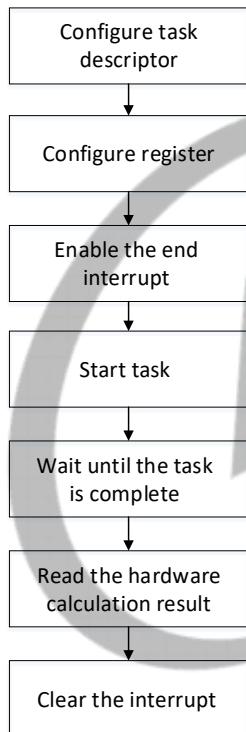

Clock Name	Description	Requirement
hclk	AHB bus clock	24 MHz – 200 MHz
mclk	MBUS clock	24 MHz – 400 MHz
ce_clk	CE work clock	24 MHz – 400 MHz

10.1.4 Programming Guidelines

10.1.4.1 Symmetrical/Asymmetrical/Hash/RNG Algorithm Operation Process

The following figure shows the process of an algorithm operation.

Figure 10-16 Task Request Process

Step 1 The software should configure a task descriptor in memory, including the related fields in the descriptor. The channel id corresponds to one channel in CE. According to algorithm type, the software should set the fields in common control, symmetric control, asymmetric control, then provide key/iv/ctr address and the data length of this task. The source and destination address and size are set based on the upper application. If there is another task concatenating after this task, then set its descriptor address at the next descriptor field. For more details for task descriptor, see section 10.1.4.2, section 10.1.4.3 and section 10.1.4.4.

- Step 2** The software should set registers. Configure the first address of the task descriptor structure to [CE Task Descriptor Address Register](#). Configure the source/destination address to [CE Current Source Address Register/CE Current Destination Address Register](#).
- Step 3** Enable the end interrupt of the corresponding task channel by setting [CE Interrupt Control Register](#).
- Step 4** The software reads [CE Task Load Register](#) to ensure that the bit0 is 0. If the bit0 is not read out to be 0, wait until it is 0, then configure the bit0 to be 1 to start task.
- Step 5** Wait for interrupt status by reading [CE Interrupt Status Register](#).
- Step 6** Read the result from the destination address.
- Step 7** Clear the interrupt.

10.1.4.2 Configuring Task Descriptor of AES

- **Common control:** Configure [Common Control](#)[6:0] to 0x0 to select AES algorithm type.
- **Symmetric control:** According to the corresponding algorithm requirements, configure [Symmetric Control](#) to select the key size, CTR width, CTS last package flag, CFB width, and AES algorithm mode, and so on.
- **Asymmetric control:** The symmetric algorithm does not need to be configured for this field.
- **Key descriptor:** Because the storage of the key requires word alignment, ensure that this descriptor is the first address of the KEY (word address).
- **IV descriptor:** In the task that requires the IV value, configure the first address of the storage space where the IV is stored here. Because the storage of the IV requires word alignment, ensure that this descriptor is the first address of the IV (word address).
- **Data length:** Configure the data length of the corresponding segment. The data length size needs to be consistent with dst_data_length (destination data length 0 +... + destination data length 7). When the algorithm is CTS mode, the higher 30-bit of the data length is the word numbers of data volume; when the data_length[1:0] is 0, the data length is the higher 30-bit, otherwise it is increased by 1. For AES CTS, the data length indicates the byte numbers of the source data; for other algorithms, it indicates the word numbers.
- **Source address:** The first address of source data segments. Because the storage of the source data requires word alignment, ensure that this descriptor is the first address (word address).
- **Source data length:** The data volume of source data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Destination address:** The first address of destination data segments. Because the storage of the destination data requires word alignment, ensure that this descriptor is the first address (word address).

- **Destination data length:** The data volume of destination data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Next descriptor:** The first address of the next task descriptor. Because the storage of the descriptor requires word alignment, ensure that this descriptor is the first address (word address).
- **Reserved:** Configure to 0x0.

10.1.4.3 Configuring Task Descriptor of HASH

- **Common control**
 - **Algorithm type:** Configure [Common Control](#)[6:0] to select SHA or HMAC algorithm type.
 - **Last HMAC plaintext:** If the algorithm type is HMAC, and the task is the last package of the message or if the message has only one package, then [Common Control](#)[15] needs to set to 1.
 - **IV mode:** The [Common Control](#)[16] (IV MODE) bit is only set to 1 in the following two scenarios, except that the bit must be configured to 0. (1). When the message is split into multiple packages, the [Common Control](#)[16] bit of other packages needs to be set to 1, except that the bit of the first package needs to be cleared to 0. (2). In special applications, if you need to customize the IV value to form the initial value of a certain HASH algorithm, you need to set the [Common Control](#)[16] bit of the first (or only one) package to 1, and the first address of the storage space where the customized IV value is stored in IV address.
- **Key descriptor:** Because the storage of the key requires word alignment, ensure that this descriptor is the first address of the KEY (word address).
- **IV descriptor:** In the task that requires the IV value, configure the first address of the storage space where the IV is stored here. Because the storage of the IV requires word alignment, ensure that this descriptor is the first address of the IV (word address).
- **Data length:** Configure the data length of the corresponding segment. The data length size needs to be consistent with dst_data_length (destination data length 0 +... + destination data length 7).
- **Source address:** The first address of source data segments. Because the storage of the source data requires word alignment, ensure that this descriptor is the first address (word address).
- **Source data length:** The data volume of source data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Destination address:** The first address of destination data segments. Because the storage of the destination data requires word alignment, ensure that this descriptor is the first address (word address).

- **Destination data length:** The data volume of destination data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Next descriptor:** The first address of the next task descriptor. Because the storage of the descriptor requires word alignment, ensure that this descriptor is the first address (word address).
- **Reserved:** Configure to 0x0.

10.1.4.4 Configuring Task Descriptor of RSA

- **Common control:** Configure [Common Control](#)[6:0] to 0x20 to select RSA algorithm type.
- **Asymmetric control:** Configure [Asymmetric Control](#)[30:28] to select the RSA width.
- **Key descriptor:** Because the storage of the key requires word alignment, ensure that this descriptor is the first address of the KEY (word address).
- **Data length:** Configure the data length of the corresponding segment. The data length size needs to be consistent with dst_data_length (destination data length 0 +... + destination data length 7).
- **Source address:** The first address of source data segments. Because the storage of the source data requires word alignment, ensure that this descriptor is the first address (word address).
- **Source data length:** The data volume of source data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Destination address:** The first address of destination data segments. Because the storage of the destination data requires word alignment, ensure that this descriptor is the first address (word address).
- **Destination data length:** The data volume of destination data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Next descriptor:** The first address of the next task descriptor. Because the storage of the descriptor requires word alignment, ensure that this descriptor is the first address (word address).
- **Reserved:** Configure to 0x0.

Bit	Read/Write	Default/Hex	Description
31:4	/	/	/
3:0	R/W1C	0x0	<p>Task Channel3–0 End Pending 0: Not finished 1: Finished It indicates whether task is completed.</p> <p>Write the corresponding channel bit of the register to clear the end flag.</p> <p>When the last task in the task chain ends, the operation of the task chain will end normally. If the task fails in the middle, the task chain will be aborted. The CE_ISR register will be automatically updated when it ends normally or aborts abnormally. And it is determined whether to generate an interrupt signal according to the IE configuration (bit31) of Common Control when the current task ends or aborts.</p> <p>If using interrupt, after receiving the interrupt, read the corresponding channel bit of CE_ISR to judge whether it ends successfully or stops failure.</p> <p>If not using interrupt, the CE_ISR status register can be continuously queried for the channel bit until the successful end flag is set or the failure stop flag is set. Write the corresponding channel bit of the register to clear the end flag.</p> <p>If it fails to stop, you can read the error code on the channel corresponding to the CE_ESR register.</p>

10.1.6.4 0x0010 CE Task Load Register (Default Value: 0x0000_0000)

Offset: 0x0010			Register Name: CE_TLR
Bit	Read/Write	Default/Hex	Description
31:1	/	/	/
0	R/W	0x0	<p>Task Load</p> <p>When set, the CE can load the descriptor of task if the task FIFO is not full.</p>

10.1.6.5 0x0014 CE Task Status Register (Default Value: 0x0000_0000)

Offset: 0x0014			Register Name: CE_TSR
Bit	Read/Write	Default/Hex	Description
31:2	/	/	/
1:0	R	0x0	Running Channel Number 00: Task channel0 01: Task channel1 10: Task channel2 11: Task channel3

10.1.6.6 0x0018 CE Error Status Register (Default Value: 0x0000_0000)

Offset: 0x0018			Register Name: CE_ESR
Bit	Read/Write	Default/Hex	Description
31:16	/	/	/
15:12	R/W1C	0x0	Task Channel3 Error Type xxx1: Algorithm not support xx1x: Data length error x1xx: keysram access error for AES 1xxx: Reserved
11:8	R/W1C	0x0	Task Channel2 Error Type xxx1: Algorithm not support xx1x: Data length error x1xx: keysram access error for AES 1xxx: Reserved
7:4	R/W1C	0x0	Task Channel1 Error Type xxx1: Algorithm not support xx1x: Data length error x1xx: keysram access error for AES 1xxx: Reserved
3:0	R/W1C	0x0	Task Channel0 Error Type xxx1: Algorithm not support xx1x: Data length error x1xx: keysram access error for AES 1xxx: Reserved

10.1.6.7 0x0024 CE Current Source Address Register (Default Value: 0x0000_0000)

Offset: 0x0024			Register Name: CE_CSA
Bit	Read/Write	Default/Hex	Description
31:0	R	0x0	CUR_SRC_ADDR Current source address

10.1.6.8 0x0028 CE Current Destination Address Register (Default Value: 0x0000_0000)

Offset: 0x0028			Register Name: CE_CDA
Bit	Read/Write	Default/Hex	Description
31:0	R	0x0	CUR_DST_ADDR Current destination address

10.1.6.9 0x002C CE Throughput Register (Default Value: 0x0000_0000)

Offset: 0x002C			Register Name: CE_TPR
Bit	Read/Write	Default/Hex	Description
31:0	R/WC	0x0	TP_NUM It indicates the throughput writing to this register at last time. Writing to this register will clear it to 0.

10.2 Security ID

The Security ID (SID) is used to program and read keys which include chip ID, thermal sensor, HASH code, and so on.

The SID module has the following features:

- 2 Kbits electrical fuse (eFuse)
- Backup eFuse information by using SID_SRAM
- A fuse only can program one time
- Burning the key to the SID
- Reading the key use status in the SID
- Loading the key to the CE

CAUTION

Before performing the burning operation, ensure that the power supply of the eFuse power pin is stable. After the burning operation is completed, cancel the power supply of the eFuse power pin.

Appendix: Glossary

The following table contains acronyms and abbreviations used in this document.

Term	Meaning
A	
ADC	Analog-to-Digital Converter
AE	Automatic Exposure
AEC	Audio Echo Cancellation
AES	Advanced Encryption Standard
AF	Automatic Focus
AGC	Automatic Gain Control
AHB	AMBA High-Speed Bus
ALC	Automatic Level Control
ANR	Active Noise Reduction
APB	Advanced Peripheral Bus
ARM	Advanced RISC Machine
AVS	Audio Video Synchronization
AWB	Automatic White Balance
B	
BROM	Boot ROM
C	
CIR	Consumer Infrared
CMOS	Complementary Metal-Oxide Semiconductor
CP15	Coprocessor 15
CPU	Central Processing Unit
CRC	Cyclic Redundancy Check
CSI	Camera Serial Interface
CVBS	Composite Video Broadcast Signal
D	
DDR	Double Data Rate
DES	Data Encryption Standard
DLL	Delay-Locked Loop
DMA	Direct Memory Access
DRC	Dynamic Range Compression
DVFS	Dynamic Voltage and Frequency Scaling
E	
ECC	Error Correction Code
eFuse	Electrical Fuse, A one-time programmable memory
EHCI	Enhanced Host Controller Interface
eMMC	Embedded Multi-Media Card
ESD	Electrostatic Discharge
F	
FBGA	Fine Pitch Ball Grid Array

Term	Meaning
FEL	Fireware Exchange Launch
FIFO	First In First Out
G	
GPIO	General Purpose Input Output
I	
I2C	Inter Integrated Circuit
I2S	Inter IC Sound
ISP	Image Signal Processor
J	
JEDEC	Joint Electron Device Engineering Council
JPEG	Joint Photographic Experts Group
JTAG	Joint Test Action Group
L	
LCD	Liquid-Crystal Display
LFBGA	Low Profile Fine Pitch Ball Grid Array
LSB	Least Significant Bit
LVDS	Low Voltage Differential Signaling
M	
MAC	Media Access Control
MIC	Microphone
MIPI	Mobile Industry Processor Interface
MLC	Multi-Level Cell
MMC	Multimedia Card
MPEG	Motion Pictures Expert Group
MSB	Most Significant Bit
N	
N/A	Not Application
NMI	Non Maskable Interrupt
NTSC	National Television Standards Committee
NVM	Non Volatile Storage Medium
O	
OHCI	Open Host Controller Interface
OTP	One Time Programmable
OWA	One Wire Audio
P	
PAL	Phase Alternating Line
PCM	Pulse Code Modulation
PHY	Physical Layer Controller
PID	Packet Identifier
PLL	Phase-Locked Loop
POR	Power-On Reset
PRCM	Power Reset Clock Management
PWM	Pulse Width Modulation

Term	Meaning
R	
R	Read only/non-Write
RGB	Read Green Blue
RGMII	Reduced Gigabit Media Independent Interface
RMII	Reduced Media Independent Interface
ROM	Read Only Memory
RSA	Rivest-Shamir-Adleman
RTC	Real Time Clock
S	
SAR	Successive Approximation Register
SD	Secure Digital
SDIO	Secure Digital Input Output
SDK	Software Development Kit
SDRAM	Synchronous Dynamic Random Access Memory
SDXC	Secure Digital Extended Capacity
SLC	Single-Level Cell
SoC	System on Chip
SPI	Serial Peripheral Interface
SRAM	Static Random Access Memory
T	
TDES	Triple Data Encryption Standard
<td>Two Wire Interface</td>	Two Wire Interface
U	
UART	Universal Asynchronous Receiver Transmitter
UDF	Undefined
USB DRD	Universal Serial Bus Dual Role Device
UTMI	USB2.0 Transceiver Macrocell Interface
